

6-axis IMU (inertial measurement unit) with sensor fusion and hearable features for TWS

Features

- Dual channels for motion tracking and bone conduction
- Power consumption: 0.95 mA in combo high-performance mode
- "Always-on" experience with low power consumption for both accelerometer and gyroscope
- Smart FIFO up to 4.5 KB
- $\pm 2/\pm 4/\pm 8/\pm 16\text{ g}$ full scale
- $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000/\pm 4000\text{ dps}$ full scale
- 3-axis audio accelerometer with flat and wide bandwidth > 1 kHz and low noise $20\text{ }\mu\text{g}/\sqrt{\text{Hz}}$
- SPI / I²C & MIPI I3C® v1.1 serial interface with main processor data synchronization
- TDM slave interface
- Advanced pedometer, step detector, and step counter
- Significant motion detection, tilt detection
- Standard interrupts: free-fall, wakeup, 6D orientation, click and double-click
- Programmable finite state machine for accelerometer, gyroscope, and external sensor data processing with high rate @ 960 Hz
- Embedded adaptive self-configuration (ASC)
- Embedded sensor fusion low-power algorithm
- Embedded temperature sensor
- Analog supply voltage: 1.71 V to 3.6 V
- Independent IO supply (extended range: 1.08 V to 3.6 V)
- Compact footprint: 2.5 mm x 3 mm x 0.71 mm
- ECOPACK and RoHS compliant

Applications

- TWS (true wireless stereo)
- Wearables
- IoT and connected devices
- User interface & power management for wearable and hearable devices

Description

The **LSM6DSV16B** is a system-in-package inertial measurement unit (IMU) featuring a 3-axis digital accelerometer and a 3-axis digital gyroscope with dual channels for processing acceleration and angular rate sensing data for motion tracking (user interface, device power management, 3D head tracking for gaming and an enhanced audio experience) as well as vibration detection for bone conduction on separate channels with dedicated configuration, processing, and filtering.

The motion tracking in high-performance mode runs at 0.6 mA and enables always-on low-power features for an optimal motion experience.

The LSM6DSV16B embeds advanced dedicated features and data processing like the finite state machine (FSM), sensor fusion low power (SFLP), and adaptive self-configuration (ASC).

The LSM6DSV16B integrates a 6-axis IMU sensor with audio accelerometer features in a compact package (2.5 x 3.0 x 0.71 mm).

1 Overview

The LSM6DSV16B is a system-in-package featuring a high-performance 3-axis digital accelerometer and 3-axis digital gyroscope with dual processing channels.

Channel 1 has been designed for user interface data processing for motion tracking and 3D head tracking. Acceleration and angular rate data are available on the primary output of the I²C / SPI / MIPI I3C® interface for the accelerometer and gyroscope with independent ODR and FS.

Channel 2 has been designed for audio acceleration data processing for bone conduction and speech-enhanced applications. Data are available on the TDM interface at 8 kHz or 16 kHz.

The event-detection interrupts enable efficient and reliable motion tracking and context awareness, implementing hardware recognition of free-fall events, 6D orientation, click and double-click sensing, activity or inactivity, stationary/motion detection and wake-up events. Finite state machine processing allows moving some algorithms from the application processor to the LSM6DSV16B sensor, enabling consistent reduction of power consumption.

Embedded FIFO with compression and dynamic allocation of significant data allows overall power saving of the system with a FIFO buffer size up to 4.5 KB.

The LSM6DSV16B MEMS sensor module leverages the robust and mature in-house manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit, which is trimmed to better match the characteristics of the sensing element.

The LSM6DSV16B is available in a small plastic, land grid array (LGA) package of 2.5 x 3.0 x 0.71 mm to address ultracompact solutions.

2 Embedded low-power features

The LSM6DSV16B has been designed to be fully compliant with Android, featuring the following on-chip functions:

- 4.5 KB FIFO data buffering, data can be compressed two or three times
 - 100% efficiency with flexible configurations and partitioning
 - Possibility to store timestamp
- Event-detection interrupts (fully configurable)
 - Free-fall
 - Wakeup
 - 6D orientation
 - Click and double-click sensing
 - Activity/inactivity recognition
 - Stationary/motion detection
- Specific IP blocks (called "embedded functions") with negligible power consumption and high-performance
 - Pedometer functions: step detector and step counters
 - Tilt
 - Significant motion detection
 - Finite state machine (FSM)
 - Adaptive self-configuration (ASC)
 - Embedded sensor fusion low-power (SFLP) algorithm

2.1

Pedometer functions: step detector and step counters

The LSM6DSV16B embeds an advanced pedometer with an algorithm running in an ultralow-power domain in order to ensure extensive battery life in battery-constrained applications.

Leveraging on enhanced configurability, the advanced embedded pedometer is suitable for a large range of applications from mobile to wearable devices.

The algorithm processes and analyzes the accelerometer waveform in order to count the user's steps during walking and running activities.

The pedometer works at 30 Hz and it is not affected by the selected device power mode (ultralow-power, low-power, high-performance), thus guaranteeing an ultralow-power experience and extreme flexibility in conjunction with other device functionalities.

The accelerometer operating mode can be changed at runtime and is based on user requirements without impacting the performance of the pedometer.

The pedometer output can be batched in the device's FIFO buffer, in order to decrease overall system supply current.

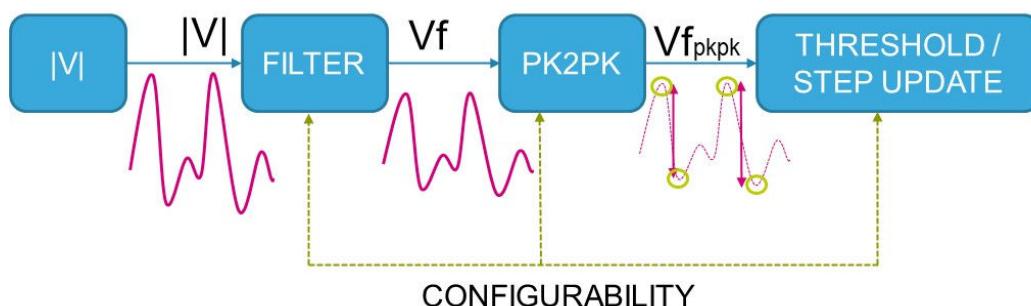

ST freely provides the support and the tools for easily configuring the device and tuning the algorithm configuration for a best-in-class user experience.

2.2 Pedometer algorithm

The pedometer algorithm is composed of a cascade of four stages:

1. Computation of the acceleration magnitude signal in order to detect the signal independently from device orientation
2. FIR filter to extract relevant frequency components and to smooth the signal by cutting off high frequencies
3. Peak detector to find the maximum and minimum of the waveform and compute the peak-to-peak value
4. Step count: if the peak-to-peak value is greater than the settled threshold, a step is counted

Figure 1. Four-stage pedometer algorithm

The LSM6DSV16B embeds a dynamic internal threshold for step detection that is updated after each peak-to-peak evaluation: the internal threshold is increased with a configurable speed if a step is detected or decreased with a configurable speed if a step is not detected.

This approach ensures high accuracy when the user starts to walk and a false peak rejection when the user is walking or running.

An internal configurable debounce algorithm can be also set to filter false walks: indeed, an accelerometer pattern is recognized as a walk or run only if a minimum number of steps are counted.

The LSM6DSV16B has been designed to reject a false-positive signal inside the algorithm core.

On top of the mechanisms detailed above, the LSM6DSV16B allows enabling and configuring a dedicated false-positive rejection block to further boost pedometer accuracy.

2.3 Tilt detection

The tilt function helps to detect activity change and has been implemented in hardware using only the accelerometer to achieve targets of both ultralow power consumption and robustness during the short duration of dynamic accelerations.

The tilt function is based on a trigger of an event each time the device's tilt changes and can be used with different scenarios, for example:

- Triggers when the phone is in a front pants pocket and the user goes from sitting to standing or standing to sitting
- Does not trigger when the phone is in a front pants pocket and the user is walking, running, or going upstairs

2.4

Significant motion detection

The significant motion detection (SMD) function generates an interrupt when a 'significant motion', that could be due to a change in user location, is detected. In the LSM6DSV16B device this function has been implemented in hardware using only the accelerometer.

SMD functionality can be used in location-based applications in order to receive a notification indicating when the user is changing location.

2.5

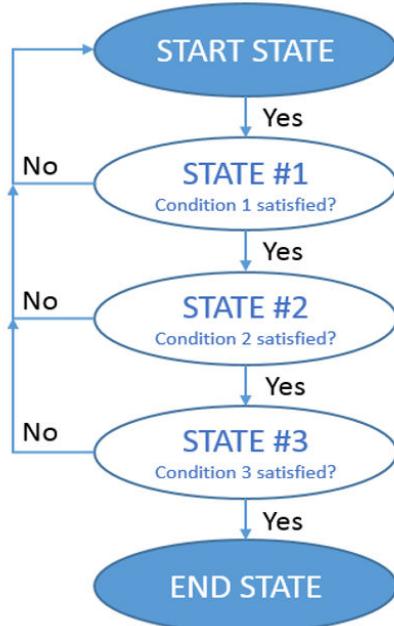

Finite state machine

The LSM6DSV16B can be configured to generate interrupt signals activated by user-defined motion patterns. To do this, up to eight embedded finite state machines can be programmed independently for motion detection such as glance gestures, absolute wrist tilt, shake and double-shake detection.

Definition of finite state machine

A state machine is a mathematical abstraction used to design logic connections. It is a behavioral model composed of a finite number of states and transitions between states, similar to a flow chart in which one can inspect the way logic runs when certain conditions are met. The state machine begins with a start state, goes to different states through transitions dependent on the inputs, and can finally end in a specific state (called stop state). The current state is determined by the past states of the system. The following figure shows a generic state machine.

Figure 2. Generic state machine

Finite state machine in the LSM6DSV16B

The LSM6DSV16B works as a combo accelerometer-gyroscope sensor, generating acceleration and angular rate output data. These data can be used as input of up to eight programs in the embedded finite state machine (Figure 3. State machine in the LSM6DSV16B).

All eight finite state machines are independent: each one has its dedicated memory area and it is independently executed. An interrupt is generated when the end state is reached or when some specific command is performed.

Figure 3. State machine in the LSM6DSV16B

2.6

Adaptive self-configuration (ASC)

The LSM6DSV16B supports the adaptive self-configuration (ASC) feature, which allows the FSM to automatically reconfigure the device in real time based on the detection of a specific motion pattern, without any intervention from the host processor. The FSM can write a subset of the device registers using the SETR command, which allows indicating the register address and the new value to be written in such a register. The access to these device registers is mutually exclusive to the host.

2.7

Sensor fusion low power

A sensor fusion low-power (SFLP) block is available in the LSM6DSV16B for generating the following data based on the accelerometer and gyroscope data processing:

- Game rotation vector, which provides a quaternion representing the attitude of the device
- Gravity vector, which provides a three-dimensional vector representing the direction of gravity
- Gyroscope bias, which provides a three-dimensional vector representing the gyroscope bias

The SFLP block is enabled by setting the SFLP_GAME_EN bit to 1 of the [EMB_FUNC_EN_A \(04h\)](#) embedded functions register.

The SFLP block can be reinitialized by setting the SFLP_GAME_INIT bit to 1 of the [EMB_FUNC_INIT_A \(66h\)](#) embedded functions register.

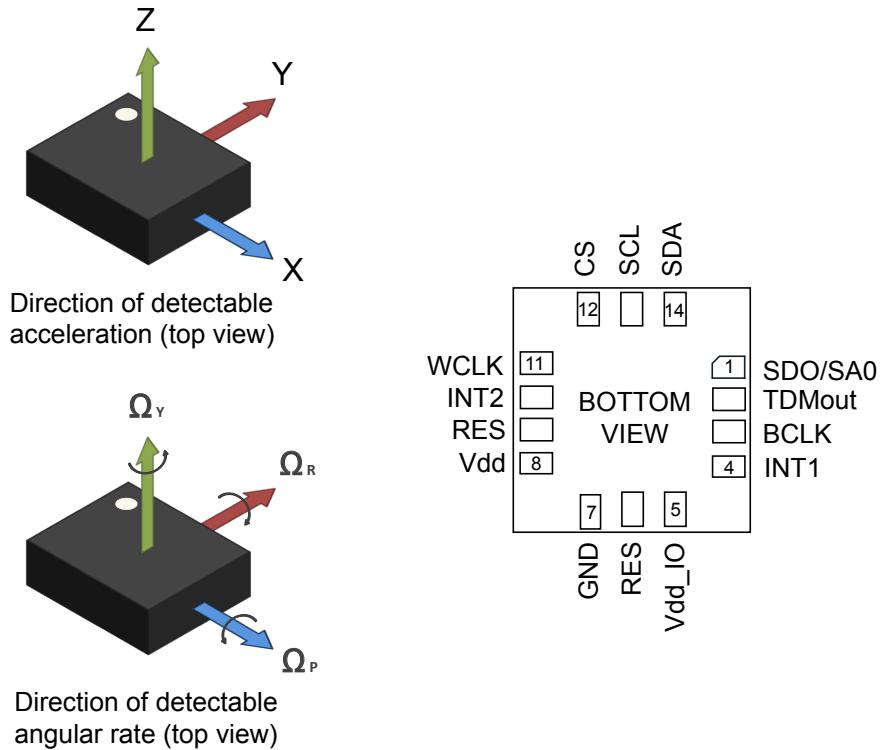

Table 1. Sensor fusion performance

Parameter	Value
Static accuracy	heading / yaw
	pitch
	roll
Low dynamic accuracy	heading / yaw
	pitch
	roll
High dynamic accuracy	heading / yaw

3 Pin description

Figure 4. Pin connections

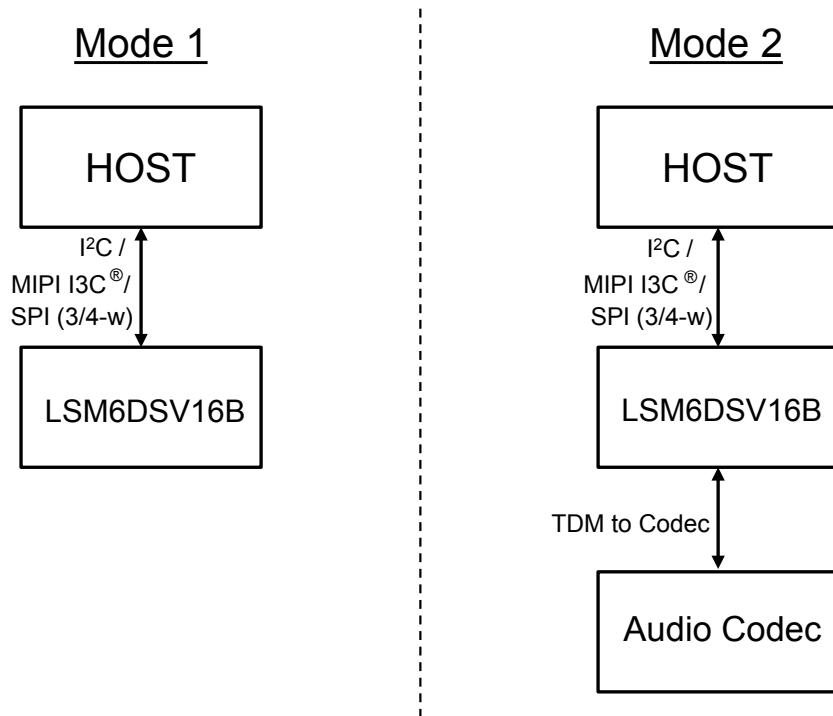

3.1 Pin connections

The LSM6DSV16B offers flexibility to connect the pins in order to have two different mode connections and functionalities. In detail:

- **Mode 1:** I²C / MIPI I3C® slave interface or SPI (3- and 4-wire) serial interface is available.
- **Mode 2:** I²C / MIPI I3C® slave interface or SPI (3- and 4-wire) serial interface and TDM interface are available.

Figure 5. LSM6DSV16B connection modes

In the following table, each mode is described for the pin connections and function.

Table 2. Pin description

Pin#	Name	Mode 1 function	Mode 2 function
1	SDO/SA0	SPI 4-wire interface serial data output (SDO) I ² C least significant bit of the device address (SA0)	SPI 4-wire interface serial data output (SDO) I ² C least significant bit of the device address (SA0)
2	TDMout	Connect to GND or Vdd_IO	TDM out
3	BCLK	Connect to GND or Vdd_IO	TDM bit clock
4	INT1	Programmable interrupt in I ² C and SPI	Programmable interrupt in I ² C and SPI

	Angular rate self-test output change ⁽¹³⁾	FS = ±250 dps	20		80	dps
Top	Operating temperature range			-40	+85	°C

1. Typical specifications are not guaranteed.
2. Sensitivity values after factory calibration test and trimming.
3. Value after calibration.
4. Measurements are performed in a uniform temperature setup and they are based on characterization data in a limited number of samples. Not measured during final test for production.
5. Gyroscope rate noise density in high-performance mode is independent of the ODR and FS setting. Gyroscope noise density is computed starting from measured noise RMS and considering $BW = ODR/2$.
6. Gyroscope RMS noise in low-power mode is independent of the ODR and FS setting.
7. Accelerometer noise density in high-performance mode is independent of the selected ODR and FS. Accelerometer noise density is computed starting from measured noise RMS and considering $BW = ODR/2$.
8. Noise density is between 10 Hz and 1 kHz.
9. Accelerometer RMS noise in low-power mode is independent of the ODR and FS setting.
10. This ODR is available when the accelerometer is in low-power mode.
11. The sign of the linear acceleration self-test output change is defined by the ST_XL_[1:0] bits in a dedicated register for all axes.
12. Accelerometer self-test limits are full-scale independent.
13. The sign of the angular rate self-test output change is defined by the ST_G_[1:0] bits in a dedicated register for all axes.

4.2 Electrical characteristics

@ $V_{dd} = 1.8\text{ V}$, $T = 25^\circ\text{C}$, unless otherwise noted.

Table 4. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ. ⁽¹⁾	Max.	Unit
V_{dd}	Supply voltage		1.71	1.8	3.6	V
V_{dd_IO}	Power supply for I/O		1.08		3.6	V
I_{ddHP}	Gyroscope and accelerometer supply current in high-performance mode (UI only)			0.6		mA
I_{ddHPT}	Gyroscope and accelerometer supply current in high-performance mode (UI + TDM)			0.95		mA
LA_IddHP	Accelerometer supply current in high-performance mode (UI only)			190		µA
LA_IddHPT	Accelerometer supply current in high-performance mode & TDM			0.6		mA
LA_IddLPM2	Accelerometer supply current in low-power mode (LPM2)	ODR = 60 Hz		20		µA
LA_IddLPM1	Accelerometer supply current in low-power mode (LPM1)	ODR = 60 Hz		17		µA
I_{ddPD}	Gyroscope and accelerometer supply current during power-down			2.6		µA
T_{on}	Turn-on time - gyroscope			30		ms
V_{IH}	Digital high-level input voltage		0.7 * V_{dd_IO}			V
V_{IL}	Digital low-level input voltage			0.3 * V_{dd_IO}		V
V_{OH}	High-level output voltage	$I_{OH} = 4\text{ mA}^{(2)}$	$V_{dd_IO} - 0.2$			V
V_{OL}	Low-level output voltage	$I_{OL} = 4\text{ mA}^{(2)}$			0.2	V
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.

2. 4 mA is the maximum driving capability, that is, the maximum DC current that can be sourced/sunk by the digital pin in order to guarantee the correct digital output voltage levels V_{OH} and V_{OL} .

4.3 Temperature sensor characteristics

@Vdd = 1.8 V, T = 25°C unless otherwise noted.

Table 5. Temperature sensor characteristics

Symbol	Parameter	Test condition	Min.	Typ. (1)	Max.	Unit
TODR ⁽²⁾	Temperature refresh rate			60		Hz
Toff	Temperature offset ⁽³⁾		-15		+15	°C
TSen	Temperature sensitivity			256		LSB/°C
TST	Temperature stabilization time ⁽⁴⁾				500	μs
T_ADC_res	Temperature ADC resolution			16		bit
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed
2. When the accelerometer is in low-power mode and the gyroscope part is turned off, the TODR value is equal to the accelerometer ODR.
3. The output of the temperature sensor is 0 LSB (typ.) at 25°C.
4. Time from power ON to valid data based on characterization data.

4.4 Communication interface characteristics

4.4.1 SPI - serial peripheral interface

Subject to general operating conditions for Vdd and Top. @Vdd_IO = 1.8 V, T = 25°C unless otherwise noted.

Table 6. SPI slave timing values

Symbol	Parameter	Value ⁽¹⁾			Unit
		Min	Typ	Max	
$f_c(SPC)$	SPI clock frequency			10	MHz
$t_c(SPC)$	SPI clock period	100			
$t_{high}(SPC)$	SPI clock high	45			
$t_{low}(SPC)$	SPI clock low	45			
$t_{su(CS)}$	CS setup time (mode 3)	5			ns
	CS setup time (mode 0)	20			
$t_h(CS)$	CS hold time (mode 3)	20			
	CS hold time (mode 0)	20			
$t_{su(SI)}$	SDI input setup time	5			
$t_h(SI)$	SDI input hold time	15			
$t_v(SO)$	SDO valid output time		15	25	
$t_{dis(SO)}$	SDO output disable time			50	
C_{load}	Bus capacitance			100	pF

- Values are evaluated at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results, not tested in production

Figure 6. SPI slave timing in mode 0

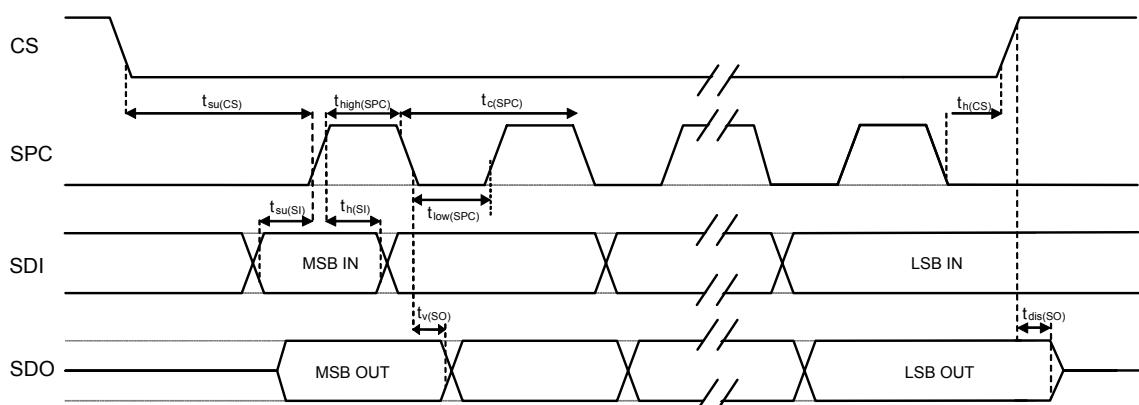

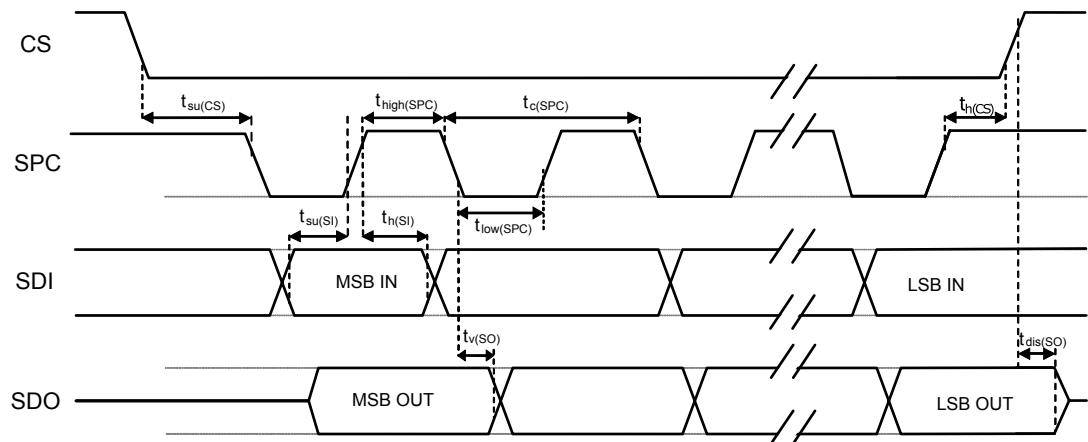

Figure 7. SPI slave timing in mode 3

Note: Measurement points are done at $0.3 \cdot Vdd_IO$ and $0.7 \cdot Vdd_IO$ for both input and output ports.

4.4.2 I²C - inter-IC control interface

Subject to general operating conditions for Vdd and Top. @Vdd_IO = 1.8 V, T = 25°C unless otherwise noted.

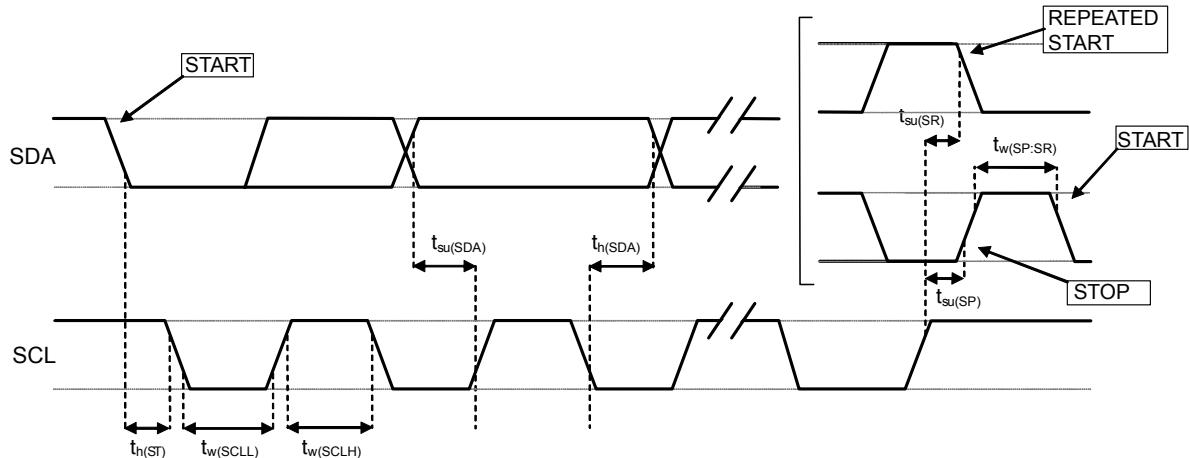

Table 7. I²C slave timing values

Symbol	Parameter	I ² C fast mode ⁽¹⁾⁽²⁾		I ² C fast mode plus ⁽¹⁾⁽²⁾		Unit
		Min	Max	Min	Max	
f _(SCL)	SCL clock frequency	0	400	0	1000	kHz
t _{w(SCLL)}	SCL clock low time	1.3		0.5		μ s
t _{w(SCLH)}	SCL clock high time	0.6		0.26		
t _{su(SDA)}	SDA setup time	100		50		
t _{h(SDA)}	SDA data hold time	0	0.9	0		
t _{h(ST)}	START/REPEATED START condition hold time	0.6		0.26		
t _{su(SR)}	REPEATED START condition setup time	0.6		0.26		
t _{su(SP)}	STOP condition setup time	0.6		0.26		
t _{w(SP:SR)}	Bus free time between STOP and START condition	1.3		0.5		
	Data valid time			0.9		0.45
	Data valid acknowledge time			0.9		0.45
C _B	Capacitive load for each bus line		400		550	pF

1. Data based on standard I²C protocol requirement, not tested in production.

2. Data for I²C fast mode and I²C fast mode plus have been validated by characterization, not tested in production.

Figure 8. I²C slave timing diagram

Note: Measurement points are done at $0.3 \cdot Vdd_IO$ and $0.7 \cdot Vdd_IO$ for both ports.

4.4.3 TDM - time-division multiplexing interface

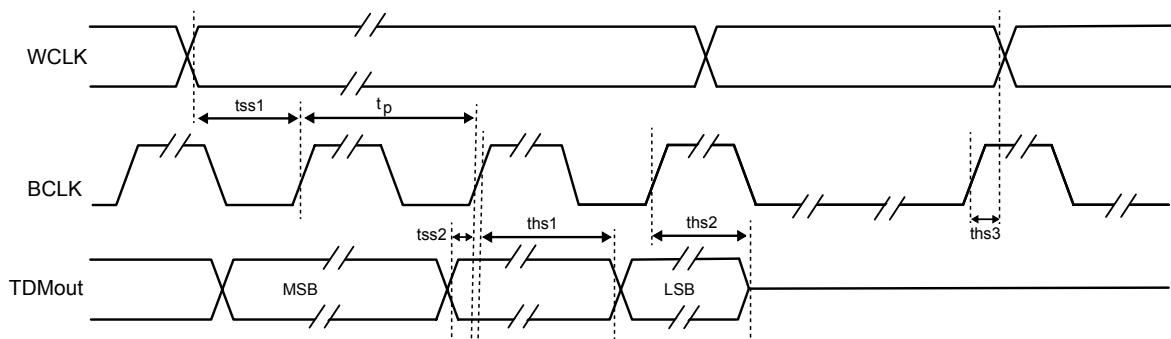

@ $V_{dd_IO} = 1.8$ V, $T = 25^\circ\text{C}$ unless otherwise noted. Refer to [Section 5.3: TDM interface](#) for additional details.

Table 8. TDM timing values

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
BCLK _f	BCLK frequency ($1/t_p$)	WCLK = 16 kHz		2048		kHz
BWCLKA	BCLK/WCLK frequency accuracy		-0.1		+0.1	%
BCLK _j	BCLK jitter			4		ns (peak to peak)
WCLK8	8 kHz WCLK mode			8		kHz
WCLK16	16 kHz WCLK mode			16		
PDC	All clock pin duty cycle - referred to BCLK (except WCLK)		45		55	%
WST	WCLK setup time before BCLK rising/falling edge (tss1)		20			ns
WHT	WCLK hold time after BCLK rising/falling edge (ths3)		20			ns
TDMST	TDMout setup time before BCLK rising/falling edge (tss2)		15			ns
TDMHTR	TDMout hold time after BCLK rising/falling edge (ths1)		15			ns
TDMHTZ	TDMout hold time of LSB after BCLK rising/falling edge (ths2)		15		65	ns
C _{BCLK}	BCLK pin capacitance				10	pF
C _{TDMout}	TDMout load capacitance				60	

Note: All setup times and hold times in [Table 8](#) and in [Figure 9](#) are valid for BCLK polarity set to “clock on rising”. If BCLK polarity is set to “clock on falling”, then all setup and hold times will refer to the falling edge of BCLK instead. Please refer to [Section 5.3: TDM interface](#) for additional details.

Figure 9. TDM timing diagram

4.5

Absolute maximum ratings

Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to +4.8	V
T _{STG}	Storage temperature range	-40 to +125	°C
Sg	Acceleration g for 0.2 ms	20,000	g
ESD	Electrostatic discharge protection (HBM)	2	kV
Vin	Input voltage on any control pin (including SDO/SA0, BCLK, WCLK, CS, SCL, SDA)	-0.3 to Vdd_IO +0.3	V

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

4.6 Terminology

4.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 g acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ± 1 g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors (see [Table 3](#)).

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time (see [Table 3](#)).

4.6.2 Zero-g and zero-rate level

Linear acceleration zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface measures 0 g on both the X-axis and Y-axis, whereas the Z-axis measures 1 g. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-g offset.

Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-g level change vs. temperature" in [Table 3](#). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a group of sensors.

Zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time (see [Table 3](#)).

5 Digital interfaces

5.1 I²C/SPI interface

The registers embedded inside the LSM6DSV16B may be accessed through both the I²C and SPI serial interfaces. The latter may be software configured to operate either in 3-wire or 4-wire interface mode. The device is compatible with SPI modes 0 and 3.

The serial interfaces are mapped to the same pins. To select/exploit the I²C interface, the CS line must be tied high (that is, connected to Vdd_IO).

Table 10. Serial interface pin description

Pin name	Pin description
CS	Enables SPI I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
SCL/SPC	I ² C serial clock (SCL) SPI serial port clock (SPC)
SDA/SDI/SDO	I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SDO/SA0	SPI serial data output (SDO) I ² C less significant bit of the device address

5.1.1 I²C serial interface

The LSM6DSV16B I²C is a bus slave. The I²C is employed to write the data to the registers, whose content can also be read back.

The relevant I²C terminology is provided in the table below.

Table 11. I²C terminology

Term	Description
Transmitter	The device that sends data to the bus
Receiver	The device that receives data from the bus
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through external pull-up resistors. When the bus is free, both the lines are high.

The I²C interface supports fast mode (400 kHz) I²C standards as well as fast mode plus (1000 kHz).

In order to disable the I²C block, I²C_I3C_disable = 1 must be written in [IF_CFG \(03h\)](#).

5.1.2 I²C operation

The transaction on the bus is started through a start (ST) signal. A start condition is defined as a high to low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated to the LSM6DSV16B is 110101xb. The SDO/SA0 pin can be used to modify the less significant bit of the device address. If the SDO/SA0 pin is connected to the supply voltage, LSb is 1 (address 1101011b). If the SDO/SA0 pin is connected to ground, the LSb value is 0 (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the high period of the acknowledge clock pulse. A receiver that has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM6DSV16B behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit subaddress (SUB) is transmitted. The increment of the address is configured by the **CTRL3 (12h)** (IF_INC).

The slave address is completed with a read/write bit. If the bit is 1 (read), a repeated start (SR) condition must be issued after the two subaddress bytes. If the bit is 0 (write) the master transmits to the slave with direction unchanged. **Table 12** explains how the SAD+read/write bit pattern is composed, listing all the possible configurations.

Table 12. SAD+read/write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W
Read	110101	0	1	11010101 (D5h)
Write	110101	0	0	11010100 (D4h)
Read	110101	1	1	11010111 (D7h)
Write	110101	1	0	11010110 (D6h)

Table 13. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 14. Transfer when master is writing multiple bytes to slave

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 15. Transfer when master is receiving (reading) one byte of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Table 16. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD+ W		SUB		SR	SAD+ R		MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA	

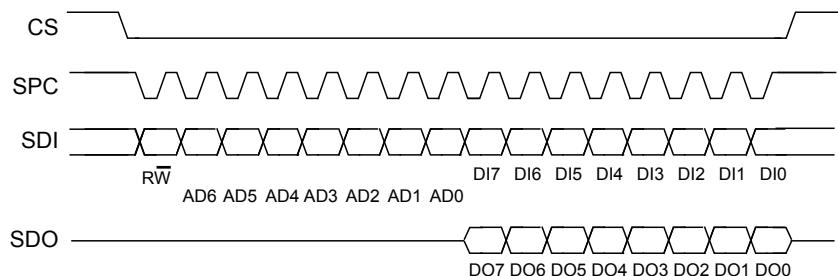

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a slave receiver does not acknowledge the slave address (that is, it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low to high transition on the SDA line while the SCL line is high is defined as a stop condition. Each data transfer must be terminated by the generation of a stop (SP) condition.

In the presented communication format, MAK is master acknowledge and NMAK is no master acknowledge.

5.1.3 SPI bus interface

The SPI on the LSM6DSV16B is a bus slave, which allows writing and reading the registers of the device.

Figure 10. Read and write protocol (in mode 3)

CS enables the serial port and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in the case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: **RW** bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

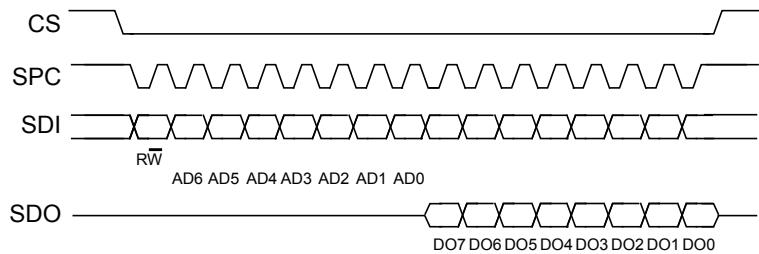

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands, further blocks of 8 clock periods are added. When the **CTRL3 (12h)** (IF_INC) bit is 0, the address used to read/write data remains the same for every block. When the **CTRL3 (12h)** (IF_INC) bit is 1, the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.1.3.1 SPI read

Figure 11. SPI read protocol (in mode 3)

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

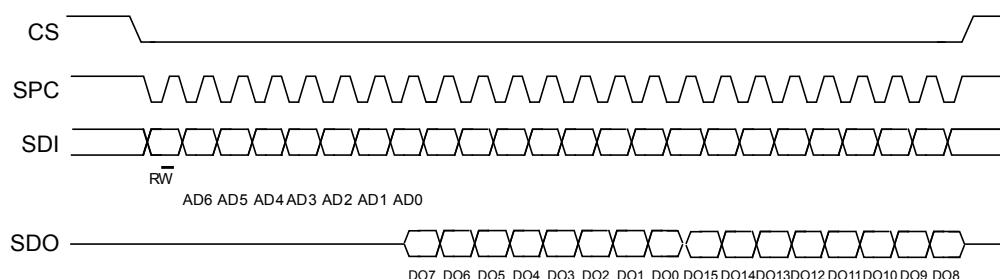

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

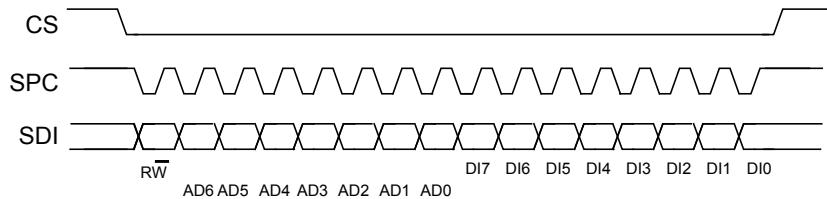

bit 16-...: data DO(...-8). Further data in multiple byte reads.

Figure 12. Multiple byte SPI read protocol (2-byte example) (in mode 3)

5.1.3.2 SPI write

Figure 13. SPI write protocol (in mode 3)

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

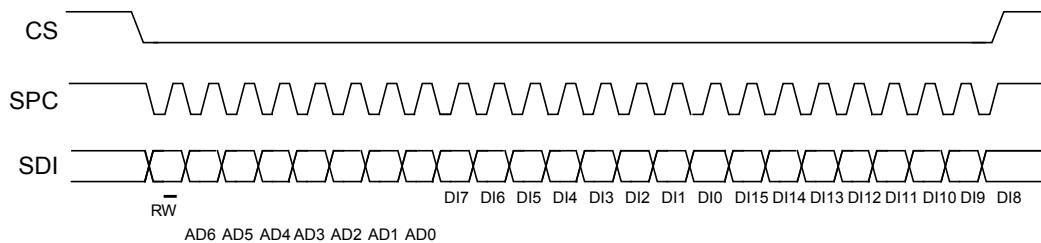

bit 0: WRITE bit. The value is 0.

bit 1 -7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16.... : data DI(...-8). Further data in multiple byte writes.

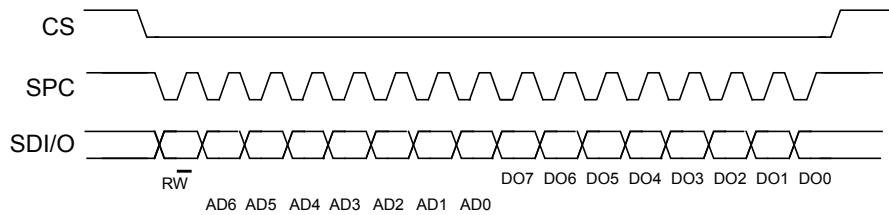

Figure 14. Multiple byte SPI write protocol (2-byte example) (in mode 3)

5.1.3.3 SPI read in 3-wire mode

3-wire mode is entered by setting the IF_CFG (03h) (SIM) bit equal to 1 (SPI serial interface mode selection).

Figure 15. SPI read protocol in 3-wire mode (in mode 3)

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5.2 MIPI I3C® interface

5.2.1 MIPI I3C® slave interface

The LSM6DSV16B interface includes an MIPI I3C® SDR only slave interface (compliant with release 1.1 of the specification) with MIPI I3C® SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- In-band interrupt request
- Slave reset pattern
- Group address
- Full range Vdd_IO support
- Asynchronous modes 0 and 1
- Error detection and recovery methods (S0-S6)

In order to disable the MIPI I3C® block, I2C_I3C_disable = 1 must be written in [IF_CFG \(03h\)](#).

5.2.2 MIPI I3C® CCC supported commands

The list of MIPI I3C® CCC commands supported by the device is detailed in the following table.

Table 17. MIPI I3C® CCC commands

Command	Command code	Default	Description
ENTDAA	0x07		DAA procedure
SETDASA	0x87		Assign dynamic address using static address 0x6B/0x6A depending on SDO pin
ENECA	0x80 / 0x00		Slave activity control (direct and broadcast)
DISEC	0x81/ 0x01		Slave activity control (direct and broadcast)
ENTAS0	0x82 / 0x02		Enter activity state (direct and broadcast)
SETXTIME	0x98 / 0x28		Timing information exchange
GETXTIME	0x99	0x06 0x00 0x06 0x92	Timing information exchange
RSTDAA	0x06		Reset the assigned dynamic address (broadcast only)
SETMWL	0x89 / 0x08		Define maximum write length during private write (direct and broadcast)
SETMRL	0x8A / 0x09		Define maximum read length during private read (direct and broadcast)
SETNEWDA	0x88		Change dynamic address
GETMWL	0x8B	0x00 0x08 (2 byte)	Get maximum write length during private write
GETMRL	0x8C	0x00 0x10 0x0A (3 byte)	Get maximum read length during private read

Command	Command code	Default	Description
GETPID	0x8D	0x02 0x08 0x00 0x71 0x92 0x0B	SDO = 1
		0x02 0x08 0x00 0x71 0x12 0x0B	SDO = 0
		0x27 (1 byte)	Bus characteristics register
GETDCR	0x8F	0x44 default	MIPI I3C® device characteristics register
0x00 0x00 (2 byte)	Status register		
0x08 0x60	Return max write and read speed		
0x95	0x00 0x11 0x18 0x00	Provide information about device capabilities and supported extended features	
	SETGRPA	0x9B	Group address assignment command
	RSTGRPA	0x2C / 0x9C	Reset the group address
	RSTACT	0x9A / 0x2A	Configure slave reset action

5.2.3 Overview of antispike filter management

The device acts as a standard I²C target as long as it has an I²C static address. The device is capable of detecting and disabling the I²C antispike filter after detecting the broadcast address (7'h7E/W). In order to guarantee proper behavior of the device, the I3C master must emit the first START, 7'h7E/W at open-drain speed using I²C fast mode plus reference timing.

After detecting the broadcast address, the device can receive the I3C dynamic address following the I3C push-pull timing. If the device is not assigned a dynamic address, then the device continues to operate as an I²C device with no antispike filter. For the case in which the host decides to keep the device as I²C with antispike filter, there is a configuration required to keep the antispike filter active. This configuration is done by writing the ASF_CTRL bit to 1 in the [IF_CFG \(03h\)](#) register. This configuration forces the antispike filter to always be turned on instead of being managed by the communication on the bus.

5.3 TDM interface

Time-division multiplexing (TDM) is a method of putting multiple data streams in one data signal by separating the signal into many frames. There are many ways to accomplish this.

5.3.1 Frame synchronization (WCLK)

The function of the WCLK is simply to identify the beginning of a frame. In particular the frame starts at the rising edge of WCLK and the WCLK widths supported are:

- 50% duty cycle
- One slot width (16 BCLK)
- One BCLK width

In TDM mode, LSM6DSV16B shall output accelerometer data on the TDMout pin at the following sampling rates:

- WCLK = 8 kHz
- WCLK = 16 kHz

5.3.2 Serial clock (BCLK)

The sole purpose of the serial clock BCLK is to shift the data out of the serial TDMout port. To this purpose, the TDM interface uses an internal counter that is set to one when the rising edge of the WCLK is detected, and it is reset to zero when the maximum number of BCLK in a WCLK period is reached.

5.3.3 Mapping the TDM axes

Within one frame, the data signal (DOUT) is divided into multiple segments. We call each segment a slot in this document.

The data slot width is fixed and equal to 16 bits.

In each slot, data should be left-justified (MSB first).

The number of slots in a WCLK frame can be variable and it depends on the ratio between BCLK and WCLK. However, as depicted in [Table 18](#) and [Table 19](#), only the slots 0, 1, 2 and 4, 5, 6 can be used to send accelerometer data, all the other slots are always set in high-impedance.

The mapping between the input data and the TDM output slots is flexible and can be configured through the I²C/SPI/I³C register mapping ([TDM_CFG0 \(6Ch\)](#)).

In particular two possible configurations can be selected:

- Axes data (Z, Y, X) mapped to TDM slots (0, 1, 2) (mapping = 0)
- Axes data (Z, Y, X) mapped to TDM slots (4, 5, 6) (mapping = 1)

Table 18. Axes Z, Y, X mapped to SLOT0, SLOT1, SLOT2

SLOT0	SLOT1	SLOT2	SLOT3	SLOT4	SLOT5	SLOT6	SLOT7	...	SLOTN
Z-axis	Y-axis	X-axis	HiZ	HiZ	HiZ	HiZ	HiZ	...	HiZ

Table 19. Axes Z, Y, X mapped to SLOT4, SLOT5, SLOT6

SLOT0	SLOT1	SLOT2	SLOT3	SLOT4	SLOT5	SLOT6	SLOT7	...	SLOTN
HiZ	HiZ	HiZ	HiZ	Z-axis	Y-axis	X-axis	HiZ	...	HiZ

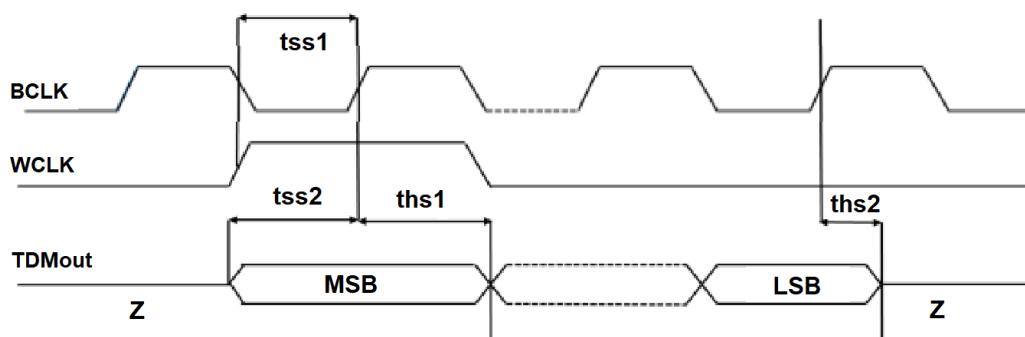

5.3.4 TDM configurations

All the LSM6DSV16B TDM configurations programmable through the I²C/SPI/I³C interface are detailed in the following subsections.

5.3.4.1 Configuration 1

- No delay: SLOT0 data MSB is sampled on the first rising edge of BCLK after rising edge of WCLK (delayed I²C register [TDM_CFG0 \(6Ch\)](#) bit 6 equal to zero)
- Data valid: data valid on the rising edge of BCLK (data_valid I²C register [TDM_CFG0 \(6Ch\)](#) bit 5 equal to zero)

Figure 16. WCLK, TDMout change on the falling edge of BCLK and are valid on the rising edge of BCLK, no delay

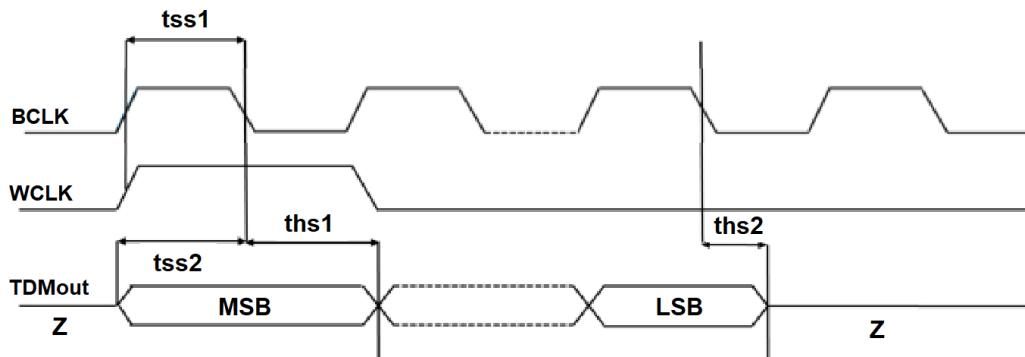

Note: Setup and hold times are defined in [Table 8. TDM timing values](#).

5.3.4.2 Configuration 2

- No delay: SLOT0 data MSB is sampled on the first falling edge of BCLK after rising edge of WCLK (delayed I²C register [TDM_CFG0 \(6Ch\)](#) bit 6 equal to zero)
- Data valid: data valid on the falling edge of BCLK (data_valid I²C register [TDM_CFG0 \(6Ch\)](#) bit 5 equal to one)

Figure 17. WCLK, TDMout change on the rising edge of BCLK and are valid on the falling edge of BCLK, no delay

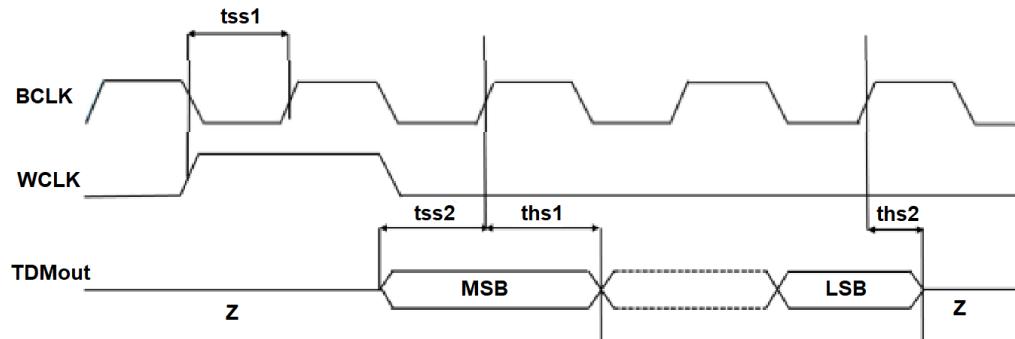

Note: Setup and hold times are defined in [Table 8. TDM timing values](#).

5.3.4.3 Configuration 3

- Delayed: SLOT0 data MSB is sampled on the second rising edge of BCLK after rising edge of WCLK (delayed I²C register TDM_CFG0 (6Ch) bit 6 equal to one)
- Data valid: data valid on the rising edge of BCLK (data_valid I²C register TDM_CFG0 (6Ch) bit 5 equal to zero)

Figure 18. WCLK, TDMout change on the falling edge of BCLK and are valid on the rising edge of BCLK, delayed

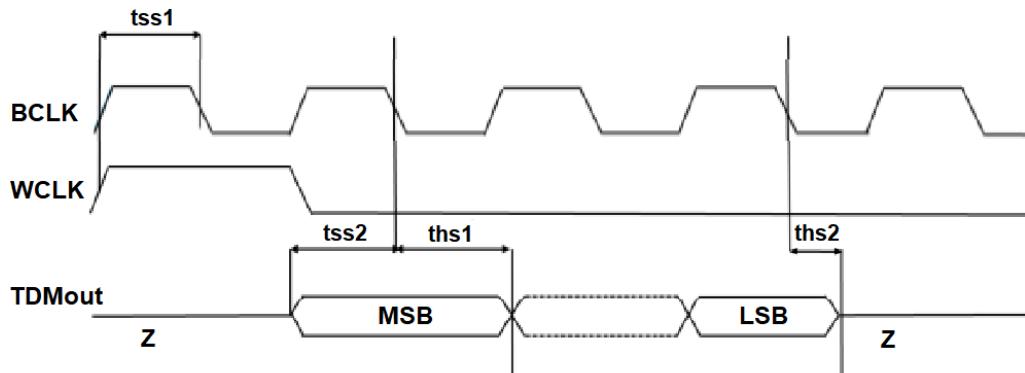

Note: Setup and hold times are defined in Table 8. TDM timing values.

5.3.4.4 Configuration 4

- Delayed: SLOT0 data MSB is sampled on the second falling edge of BCLK after rising edge of WCLK (delayed I²C register TDM_CFG0 (6Ch) bit 6 equal to one)
- Data valid: data valid on the falling edge of BCLK (data_valid I²C register TDM_CFG0 (6Ch) bit 5 equal to one)

Figure 19. WCLK, TDMout change on the rising edge of BCLK and are valid on the falling edge of BCLK, delayed

Note: Setup and hold times are defined in Table 8. TDM timing values.

6 Functionality

6.1 Operating modes

In the LSM6DSV16B, the accelerometer and the gyroscope can be turned on/off independently of each other and are allowed to have different ODRs and power modes.

The LSM6DSV16B has three operating modes available:

- Only accelerometer active and gyroscope in power-down
- Only gyroscope active and accelerometer in power-down
- Both accelerometer and gyroscope sensors active with independent ODR and power mode

The accelerometer is activated from power-down by writing ODR_XL_[3:0] in [CTRL1 \(10h\)](#) while the gyroscope is activated from power-down by writing ODR_G_[3:0] in [CTRL2 \(11h\)](#). For combo mode, the ODRs are totally independent.

In addition to the accelerometer mode above, a dedicated TDM output can be used for the audio accelerometer output.

6.2 Accelerometer power modes

In the LSM6DSV16B, the accelerometer can be configured in three different operating modes: power-down mode, low-power mode, and high-performance mode.

The operating mode selected depends on the value of the OP_MODE_XL_[2:0] bits in [CTRL1 \(10h\)](#).

If the value of the OP_MODE_XL_[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

In high-performance mode, the analog antialiasing filter is active.

Low-power mode is available for lower ODRs (1.875 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz). The three low-power modes are enabled by setting OP_MODE_XL_[2:0] to 100 (LPM1), 101 (LPM2), 110 (LPM3).

The embedded functions based on accelerometer data (free-fall, 6D, tap/double-tap, wake-up, activity/inactivity, stationary/motion, step counter, step detection, significant motion, tilt) and the FIFO batching functionality are supported in all modes.

6.3 Accelerometer dual-channel mode

The LSM6DSV16B accelerometer block has a dual-channel architecture able to work with two different full scales simultaneously. By default, the device operates in single-channel mode supporting FS scale values from $\pm 2\text{ g}$ through $\pm 16\text{ g}$ and different power modes, as described in [Section 6.2: Accelerometer power modes](#). The block diagrams in the following figures show the configuration of acceleration data processing in the two different modes.

Figure 20. Single-channel mode ($\text{XL_DualC_EN} = 0$)

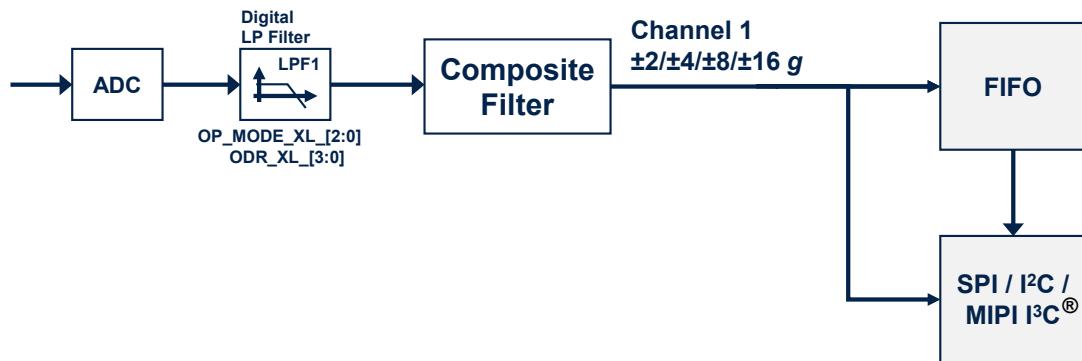

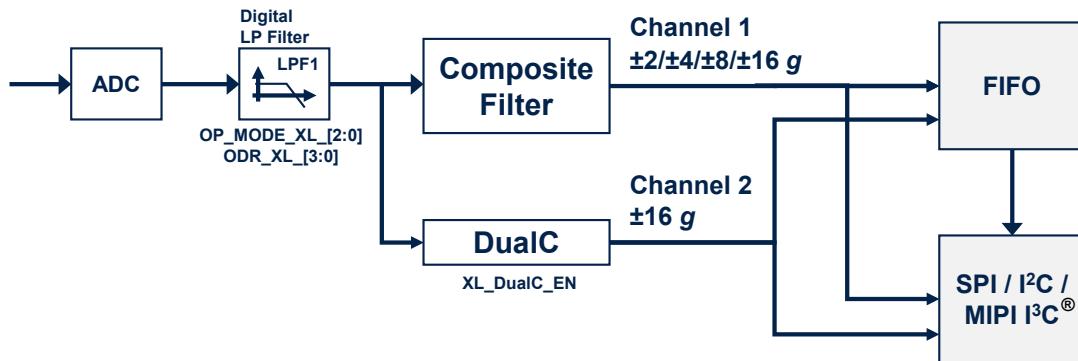

Figure 21. Dual-channel mode ($\text{XL_DualC_EN} = 1$)

The dual-channel functionality can be enabled/disabled by configuring the bit `XL_DualC_EN` to 1 (enable) or to 0 (disable) in `CTRL8 (17h)`.

Referring to [Figure 21. Dual-channel mode \(\$\text{XL_DualC_EN} = 1\$ \)](#), when the dual-channel mode has been activated:

1. Channel 1 supports user-selectable full-scale acceleration range of $\pm 2/\pm 4/\pm 8/\pm 16\text{ g}$ based on the value of the `FS_XL_[1:0]` bits in the `CTRL8 (17h)` register.
2. Channel 2 full scale is set to $\pm 16\text{ g}$. Acceleration data are available in the output registers from `UI_OUTZ_L_A_DualC (34h)` and `UI_OUTZ_H_A_DualC (35h)` through `UI_OUTX_L_A_DualC (38h)` and `UI_OUTX_H_A_DualC (39h)`.

6.4

Gyroscope power modes

In the LSM6DSV16B, the gyroscope can be configured in four different operating modes: power-down mode, sleep mode, low-power mode and high-performance mode.

The operating mode selected depends on the value of the OP_MODE_G_[2:0] bits in [CTRL2 \(11h\)](#).

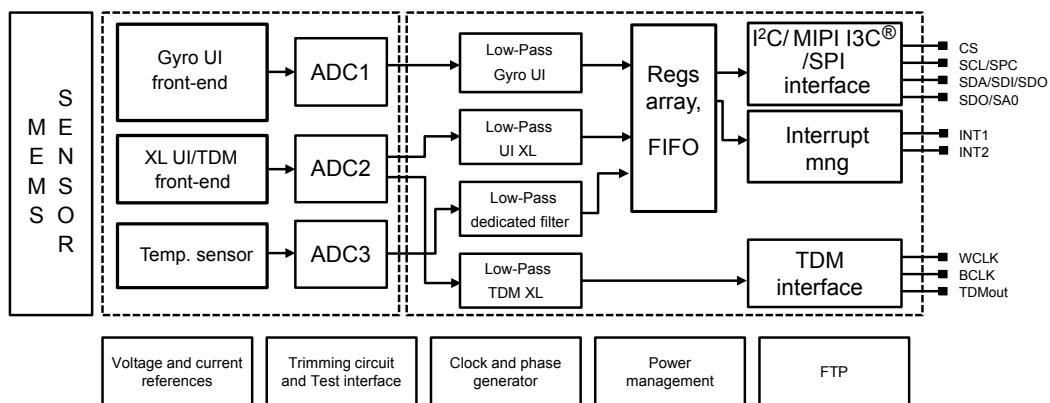

If the value of the OP_MODE_G_[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

Low-power mode is available for lower ODRs (7.5 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz) and it is enabled by setting the the OP_MODE_G_[2:0] bits to 101.

6.5

Block diagram of filters

Figure 22. Block diagram of filters

6.5.1 Block diagrams of the accelerometer filters

In the LSM6DSV16B, the filtering chain for the accelerometer part is composed of the following:

- Digital filter (LPF1)
- Composite filter

Details of the block diagram appear in the following figure.

Figure 23. Accelerometer UI chain

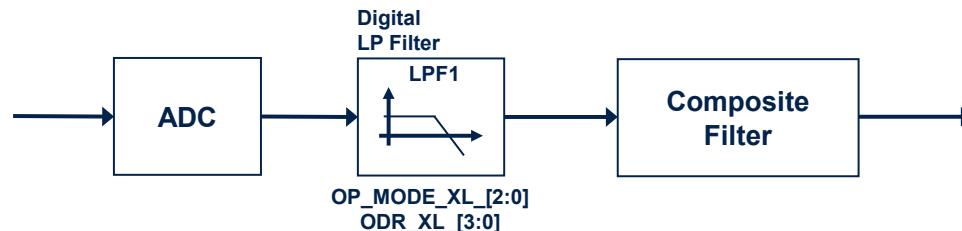

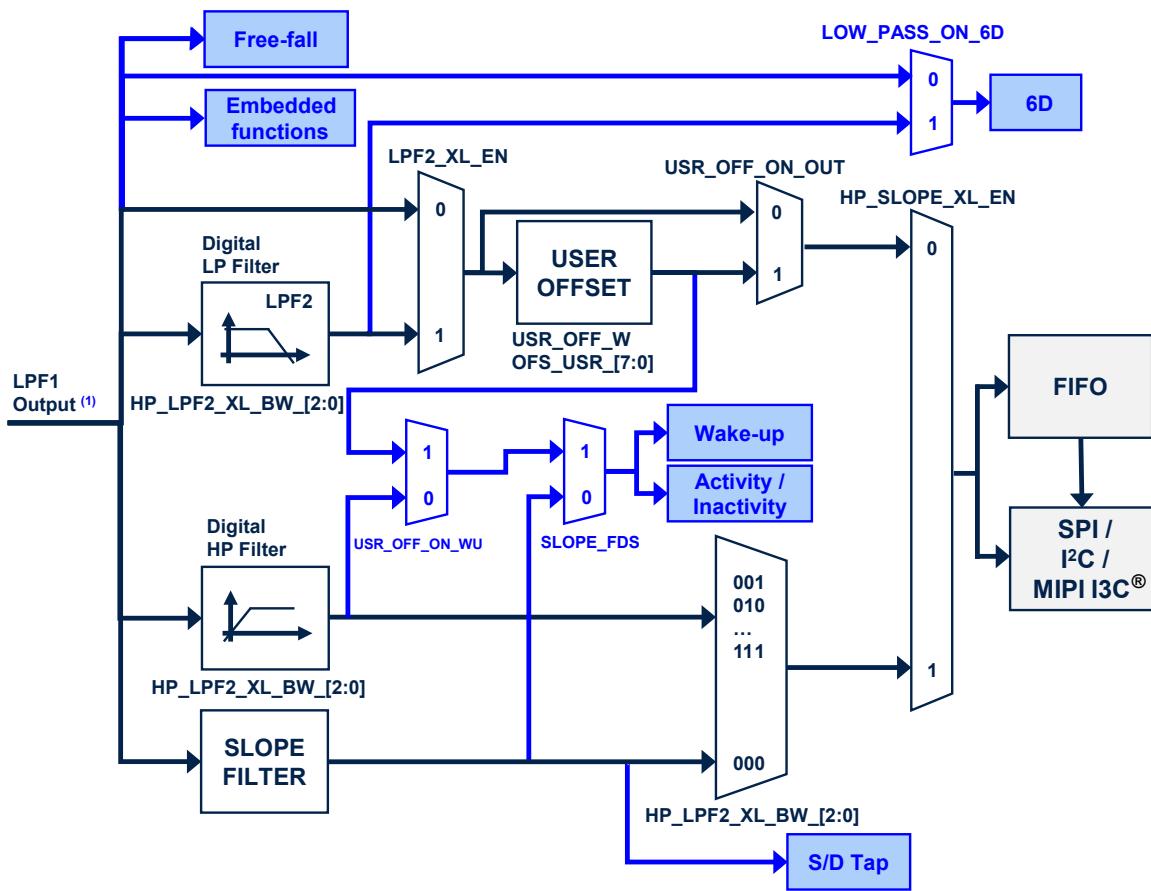

Figure 24. Accelerometer composite filter

1. The cutoff value of the LPF1 output is $ODR/2$ when the accelerometer is in high-performance mode. This value is equal to 3100 Hz when the accelerometer is in low-power mode 1 (2 mean), 912 Hz in low-power mode 2 (4 mean) or 431 Hz in low-power mode 3 (8 mean).

Note:

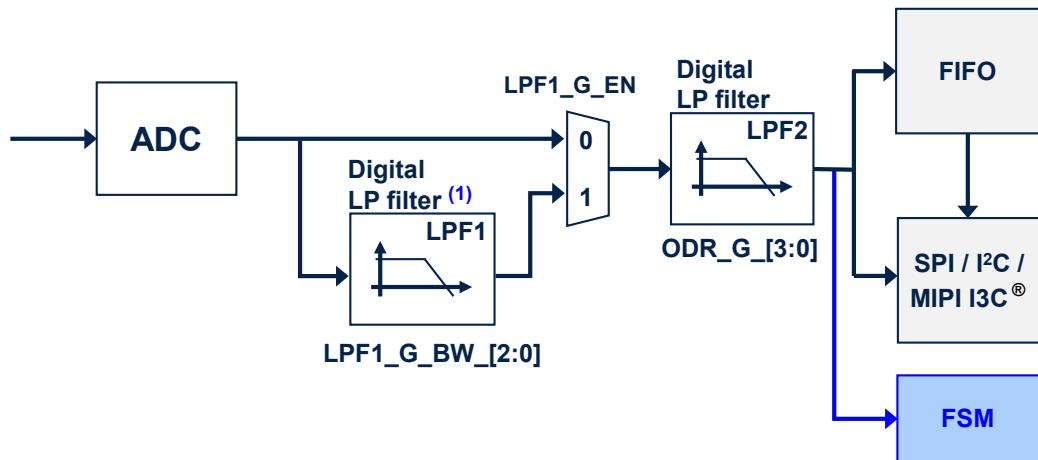

Embedded functions include finite state machine, pedometer, step detector and step counter, significant motion detection, and tilt functions.

6.5.2 Block diagrams of the gyroscope filters

In the LSM6DSV16B, the gyroscope filtering chain depends on the mode configuration:

- Mode 1 (for user interface (UI) functionality through primary interface) and mode 2

Figure 25. Gyroscope digital chain - mode 1 (UI) and mode 2

1. *The LPF1 filter is available in high-performance mode only. If the gyroscope is configured in low-power mode, the LPF1 filter is bypassed.*

In this configuration, the gyroscope ODR is selectable from 7.5 Hz up to 7.68 kHz. A low-pass filter (LPF1) is available, for more details about the filter characteristics see [Table 60. Gyroscope LPF1 + LPF2 bandwidth selection](#).

The digital LPF2 filter's cutoff frequency depends on the selected gyroscope ODR, as indicated in the following table.

Table 20. Gyroscope LPF2 bandwidth selection

Gyroscope ODR [Hz]	LPF2 cutoff [Hz]
7.5	3.4
15	6.6
30	13.0
60	24.6
120	49
240	96
480	187
960	342
1.92 kHz	490
3.84 kHz	527
7.68 kHz	537

Note: Data can be acquired from the output registers and FIFO over the primary I²C/MIPI I3C®/SPI interface.

6.6

FIFO

The presence of a FIFO allows consistent power saving for the system since the host processor does not need continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The LSM6DSV16B embeds 1.5 KB of data in FIFO (up to 4.5 KB with the compression feature enabled) to store the following data:

- Gyroscope
- Accelerometer
- Step counter
- Timestamp
- Temperature
- SFLP output data (quaternion, gyroscope bias, gravity vector)

Writing data in the FIFO can be configured to be triggered by the:

- Accelerometer / gyroscope data-ready signal
- Step detection signal

The applications have maximum flexibility in choosing the rate of batching for physical sensors with FIFO-dedicated configurations: accelerometer, gyroscope, and temperature sensor batch rates can be selected by the user. The step counter can be stored in FIFO with the associated timestamp each time a step is detected. It is possible to select decimation for timestamp batching in FIFO with a factor of 1, 8, or 32.

The reconstruction of a FIFO stream is a simple task thanks to the FIFO_DATA_OUT_TAG byte that allows recognizing the meaning of a word in FIFO.

FIFO allows correct reconstruction of the timestamp information for each sensor stored in FIFO. If a change in the ODR or BDR (batch data rate) configuration is performed, the application can correctly reconstruct the timestamp and know exactly when the change was applied without disabling FIFO batching. FIFO stores information of the new configuration and timestamp in which the change was applied in the device.

Finally, FIFO embeds a compression algorithm that the user can enable in order to have up to 4.5 KB data stored in FIFO and take advantage of interface communication length for FIFO flushing and communication power consumption.

The programmable FIFO watermark threshold can be set in the [FIFO_CTRL1 \(07h\)](#) register using the WTM[7:0] bits. To monitor the FIFO status, dedicated registers ([FIFO_STATUS1 \(1Bh\)](#), [FIFO_STATUS2 \(1Ch\)](#)) can be read to detect FIFO overrun events, FIFO full status, FIFO empty status, FIFO watermark status, and the number of unread samples stored in the FIFO. To generate dedicated interrupts on the INT1 and INT2 pins of these status events, the configuration can be set in [INT1_CTRL \(0Dh\)](#) and [INT2_CTRL \(0Eh\)](#).

The FIFO buffer can be configured according to seven different modes:

- Bypass mode
- FIFO mode
- Continuous mode
- Continuous-to-FIFO mode
- ContinuousWTM-to-full mode
- Bypass-to-continuous mode
- Bypass-to-FIFO mode

Each mode is selected by the FIFO_MODE_[2:0] bits in the [FIFO_CTRL4 \(0Ah\)](#) register.

6.6.1

Bypass mode

In Bypass mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 000), the FIFO is not operational and it remains empty. Bypass mode is also used to reset the FIFO when in FIFO mode.

6.6.2 FIFO mode

In FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 001) data from the output channels are stored in the FIFO until it is full.

To reset FIFO content, bypass mode should be selected by writing [FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#)) to 000. After this reset command, it is possible to restart FIFO mode by writing [FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#)) to 001.

The FIFO buffer memorizes up to 4.5 KB of data (with compression enabled) but the depth of the FIFO can be resized by setting the WTM[7:0] bits in [FIFO_CTRL1 \(07h\)](#). If the STOP_ON_WTM bit in [FIFO_CTRL2 \(08h\)](#) is set to 1, FIFO depth is limited up to the WTM[7:0] bits in the [FIFO_CTRL1 \(07h\)](#) register.

6.6.3 Continuous mode

Continuous mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 110) provides a continuous FIFO update: as new data arrives, the older data is discarded.

A FIFO threshold flag [FIFO_STATUS2 \(1Ch\)](#)([FIFO_WTM_IA](#)) is asserted when the number of unread samples in FIFO is greater than or equal to [FIFO_CTRL1 \(07h\)](#) (WTM[7:0]).

It is possible to route the [FIFO_WTM_IA](#) flag to the INT1 pin by writing in register [INT1_CTRL \(0Dh\)](#) ([INT1_FIFO_TH](#)) = 1 or to the INT2 pin by writing in register [INT2_CTRL \(0Eh\)](#)([INT2_FIFO_TH](#)) = 1.

A full-flag interrupt can be enabled, [INT1_CTRL \(0Dh\)](#)([INT1_FIFO_FULL](#)) = 1 or [INT2_CTRL \(0Eh\)](#)([INT2_FIFO_FULL](#)) = 1, in order to indicate FIFO saturation and eventually read its content all at once.

If an overrun occurs, at least one of the oldest samples in FIFO has been overwritten and the [FIFO_OVR_IA](#) flag in [FIFO_STATUS2 \(1Ch\)](#) is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in [FIFO_STATUS1 \(1Bh\)](#) and [FIFO_STATUS2 \(1Ch\)](#)([DIFF_FIFO_\[8:0\]](#)).

6.6.4 Continuous-to-FIFO mode

In continuous-to-FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 011), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 1, FIFO operates in FIFO mode.

When the selected trigger bit is equal to 0, FIFO operates in continuous mode.

6.6.5 ContinuousWTM-to-full mode

In continuousWTM-to-full mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 010), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 0, FIFO operates in continuous mode with the FIFO size limited to the FIFO watermark level (defined by the WTM[7:0] bits in the [FIFO_CTRL1 \(07h\)](#) register).

When the selected trigger bit is equal to 1, FIFO continues to store data until it is full.

6.6.6 Bypass-to-continuous mode

In bypass-to-continuous mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 100), data measurement storage inside FIFO operates in continuous mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.6.7 Bypass-to-FIFO mode

In bypass-to-FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 111), data measurement storage inside FIFO operates in FIFO mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.6.8 FIFO reading procedure

The data stored in FIFO are accessible from dedicated registers and each FIFO word is composed of 7 bytes: one tag byte ([FIFO_DATA_OUT_TAG \(78h\)](#), in order to identify the sensor, and 6 bytes of fixed data ([FIFO_DATA_OUT](#) registers from (79h) to (7Eh)).

The DIFF_FIFO_[8:0] field in the [FIFO_STATUS1 \(1Bh\)](#) and [FIFO_STATUS2 \(1Ch\)](#) registers contains the number of words (1 byte TAG + 6 bytes DATA) collected in FIFO.

In addition, it is possible to configure a counter of the batch events of accelerometer or gyroscope sensors. The flag COUNTER_BDR_IA in [FIFO_STATUS2 \(1Ch\)](#) alerts that the counter reaches a selectable threshold ([CNT_BDR_TH_\[9:0\]](#) field in [COUNTER_BDR_REG1 \(0Bh\)](#) and [COUNTER_BDR_REG2 \(0Ch\)](#)). This allows triggering the reading of FIFO with the desired latency of one single sensor. The sensor is selectable using the TRIG_COUNTER_BDR_[1:0] bits in [COUNTER_BDR_REG1 \(0Bh\)](#). As for the other FIFO status events, the flag COUNTER_BDR_IA can be routed on the INT1 or INT2 pins by asserting the corresponding bits (INT1_CNT_BDR of [INT1_CTRL \(0Dh\)](#) and INT2_CNT_BDR of [INT2_CTRL \(0Eh\)](#)).

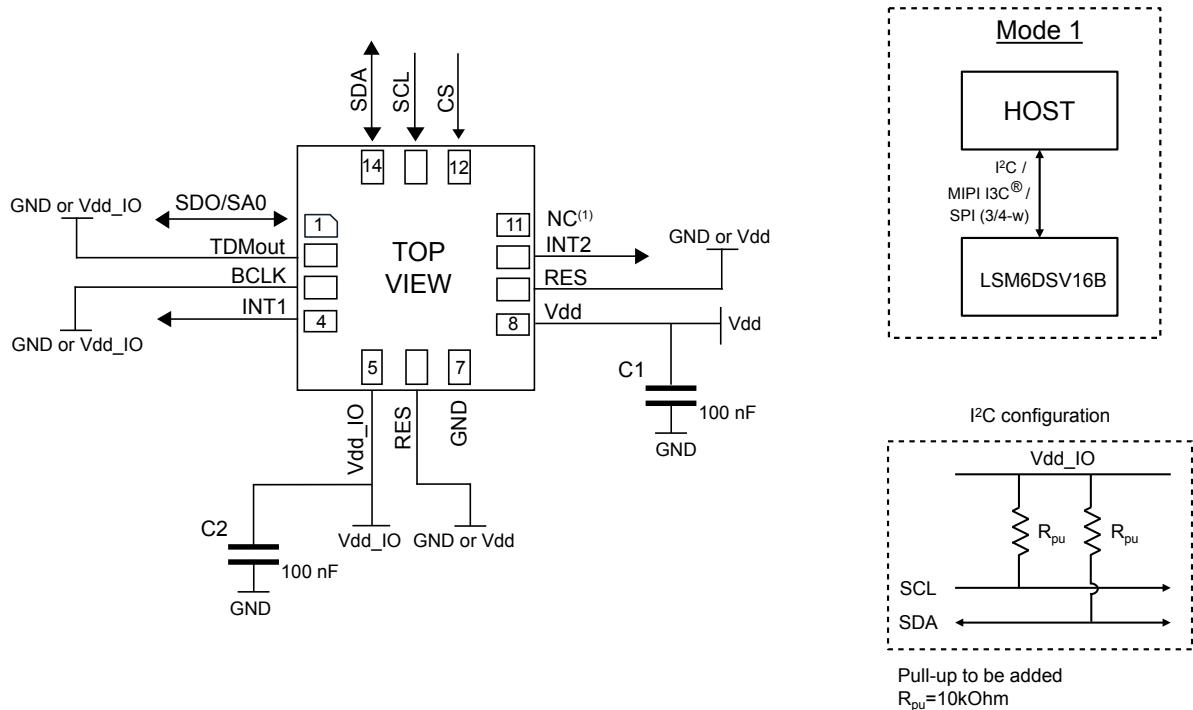

In order to maximize the amount of accelerometer and gyroscope data in FIFO, the user can enable the compression algorithm by setting to 1 both the FIFO_COMPR_EN bit in [EMB_FUNC_EN_B \(05h\)](#) (embedded functions registers bank) and the FIFO_COMPR_RT_EN bit in [FIFO_CTRL2 \(08h\)](#). When compression is enabled, it is also possible to force writing non-compressed data at a selectable rate using the UNCOMPR_RATE_[1:0] field in [FIFO_CTRL2 \(08h\)](#).

Meta information about accelerometer and gyroscope sensor configuration changes can be managed by enabling the ODR_CHG_EN bit in [FIFO_CTRL2 \(08h\)](#).

7 Application hints

7.1 LSM6DSV16B electrical connections in mode 1

Figure 26. LSM6DSV16B electrical connections in mode 1

1. Leave pin electrically unconnected and soldered to PCB.

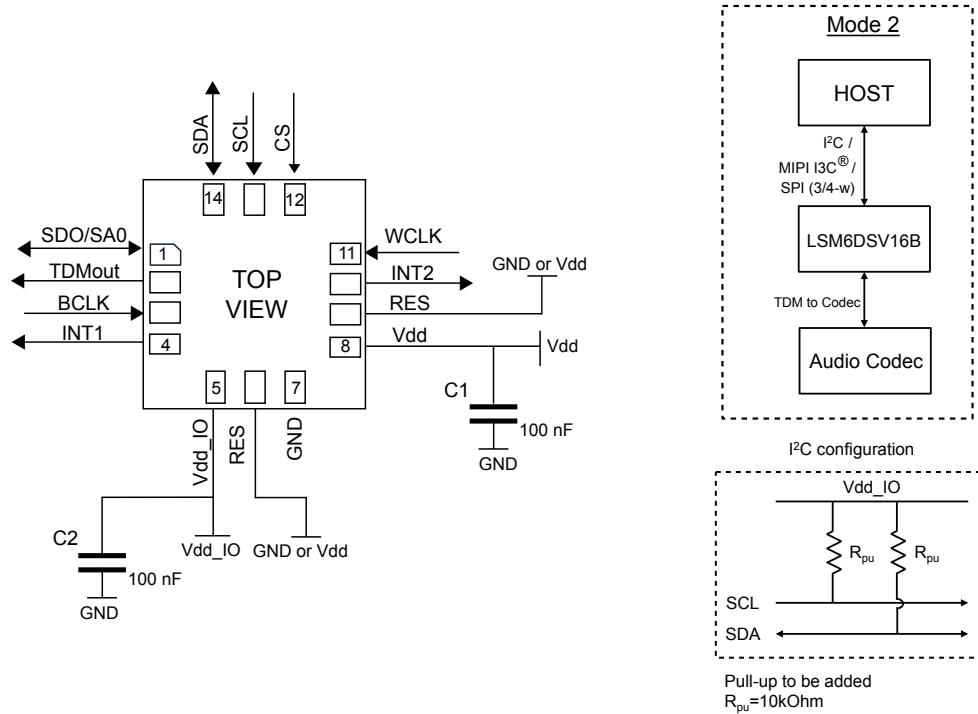

The device core is supplied through the Vdd line. Power supply decoupling capacitors ($C_1, C_2 = 100 \text{ nF}$ ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3C[®] interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3C[®] interface.

7.2 LSM6DSV16B electrical connections in mode 2

Figure 27. LSM6DSV16B electrical connections in mode 2

The device core is supplied through the Vdd line. Power supply decoupling capacitors ($C_1, C_2 = 100 \text{ nF}$ ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3C® primary interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3C® primary interface.

7.3 LSM6DSV16B internal pin status

Table 21. Internal pin status

Pin #	Name	Mode 1 function	Mode 2 function	Pin status mode 1	Pin status mode 2
1	SDO	SPI 4-wire interface serial data output (SDO)	SPI 4-wire interface serial data output (SDO)	Default: input without pull-up Pull-up is enabled if bit SDO_PU_EN = 1 in PIN_CTRL (02h).	Default: input without pull-up Pull-up is enabled if bit SDO_PU_EN = 1 in PIN_CTRL (02h).
	SA0	I ² C least significant bit of the device address (SA0) MIPI I3C® least significant bit of the static address (SA0)	I ² C least significant bit of the device address (SA0) MIPI I3C® least significant bit of the static address (SA0)		
2	TDMout	Connect to GND or Vdd_IO	TDM out	Default: input without pull-up Pull-up is enabled if TDM_OUT_PU_EN = 1 in IF_CFG (03h).	Default: input without pull-up Pull-up is enabled if TDM_OUT_PU_EN = 1 in IF_CFG (03h).
3	BCLK	Connect to GND or Vdd_IO	TDM bit clock	Default: input without pull-up/down	Default: input without pull-up/down
4	INT1	Programmable interrupt in I ² C and SPI	Programmable interrupt in I ² C and SPI	Default: output forced to ground	Default: output forced to ground
5	Vdd_IO	Power supply for I/O pins	Power supply for I/O pins		
6	RES	Connect to Vdd or GND	Connect to Vdd or GND		
7	GND	0 V supply	0 V supply		
8	Vdd	Power supply	Power supply		
9	RES	Connect to Vdd or GND	Connect to Vdd or GND		
10	INT2	Programmable interrupt in I ² C and SPI	Programmable interrupt in I ² C and SPI	Default: output forced to ground	Default: output forced to ground
11	WCLK	Connect to Vdd_IO or leave unconnected	TDM word clock	Default: input with pull-up Pull-up is disabled if TDM_WCLK_PU_DIS = 1 in PIN_CTRL (02h).	Default: input with pull-up Pull-up is disabled if TDM_WCLK_PU_DIS = 1 in PIN_CTRL (02h).
12	CS	I ² C / SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)	I ² C / SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)	Default: input with pull-up Pull-up is disabled if bit I2C_I3C_disable = 1 in IF_CFG (03h).	Default: input with pull-up Pull-up is disabled if bit I2C_I3C_disable = 1 in IF_CFG (03h).
13	SCL	I ² C / MIPI I3C® serial clock (SCL) / SPI serial port clock (SPC)	I ² C / MIPI I3C® serial clock (SCL) / SPI serial port clock (SPC)	Default: input without pull-up	Default: input without pull-up
14	SDA	I ² C / MIPI I3C® serial data (SDA) / SPI serial data input (SDI) / 3-wire interface serial data output (SDO)	I ² C / MIPI I3C® serial data (SDA) / SPI serial data input (SDI) / 3-wire interface serial data output (SDO)	Default: input without pull-up Pull-up is enabled if bit SDA_PU_EN = 1 in IF_CFG (03h).	Default: input without pull-up Pull-up is enabled if bit SDA_PU_EN = 1 in IF_CFG (03h).

Internal pull-up value is from 30 kΩ to 50 kΩ, depending on Vdd_IO.

8 Register mapping

The table given below provides a list of the 8/16-bit registers embedded in the device and the corresponding addresses.

All these registers are accessible from the primary SPI/I²C/MIPI I3C[®] interface only.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

9 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate, and temperature data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

9.1 FUNC_CFG_ACCESS (01h)

Enable embedded functions (R/W)

Table 23. FUNC_CFG_ACCESS register

EMB_FUNC_REG_ACCESS	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	FSM_WR_CTRL_EN	SW_POR	0 ⁽¹⁾	0 ⁽¹⁾
---------------------	------------------	------------------	------------------	----------------	--------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 24. FUNC_CFG_ACCESS register description

EMB_FUNC_REG_ACCESS	Enables access to the embedded functions configuration registers. ⁽¹⁾ Default value: 0
FSM_WR_CTRL_EN	Enables the control of the CTRL registers to FSM (FSM can change some configurations of the device autonomously). Default value: 0 (0: disabled; 1: enabled)
SW_POR	Global reset of the device. Default value: 0

1. Details concerning the embedded functions configuration registers are available in [Section 10: Embedded functions register mapping](#) and [Section 11: Embedded functions register description](#).

9.2 PIN_CTRL (02h)

WCLK and SDO pin pull-up register (R/W). This register is not reset during the software reset procedure (see bit 0 of the [CTRL3 \(12h\) register](#)).

Table 25. PIN_CTRL register

TDM_WCLK_PU_DIS	SDO_PU_EN	IBHR_POR_EN	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	1 ⁽²⁾	1 ⁽²⁾
-----------------	-----------	-------------	------------------	------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.
2. This bit must be set to 1 for the correct operation of the device.

Table 26. PIN_CTRL register description

TDM_WCLK_PU_DIS	Disables pull-up on WCLK pin. Default value: 0 (0: WCLK pin with pull-up; 1: WCLK pin pull-up disconnected)
SDO_PU_EN	Enables pull-up on SDO pin. Default value: 0 (0: SDO pin pull-up disconnected; 1: SDO pin with pull-up)
IBHR_POR_EN	Selects the action the device performs after "reset whole chip" I3C pattern. Default value: 1 (0: Configuration reset (SW reset + dynamic address reset); (1: Global reset (POR reset))

9.3 IF_CFG (03h)

Interface configuration register (R/W). This register is not reset during the software reset procedure (see bit 0 of the **CTRL3 (12h)** register).

Table 27. IF_CFG register

SDA_PU_EN	TDM_OUT_PU_EN	ASF_CTRL	H_LACTIVE	PP_OD	SIM	0 ⁽¹⁾	I2C_I3C_disable
-----------	---------------	----------	-----------	-------	-----	------------------	-----------------

1. This bit must be set to 0 for the correct operation of the device.

Table 28. IF_CFG register description

SDA_PU_EN	Enables pull-up on SDA pin. Default value: 0 (0: SDA pin pull-up disconnected; 1: SDA pin with pull-up)
TDM_OUT_PU_EN	Enables pull-up on TDMout pin. Default value: 0 (0: TDMout pin pull-up disconnected; 1: TDMout pin with pull-up)
ASF_CTRL	Enables antispike filters. Default value: 0 (0: antispike filters are managed by the protocol and turned off after the broadcast address; 1: antispike filters on SCL and SDA lines are always enabled)
H_LACTIVE	Interrupt activation level. Default value: 0 (0: interrupt output pins active high; 1: interrupt output pins active low)
PP_OD	Push-pull/open-drain selection on INT1 and INT2 pins. Default value: 0 (0: push-pull mode; 1: open-drain mode)
SIM	SPI serial interface mode selection. Default value: 0 (0: 4-wire interface; 1: 3-wire interface)
I2C_I3C_disable	Disables I ² C and MIPI I3C [®] interfaces. Default value: 0 (0: SPI, I ² C, and MIPI I3C [®] interfaces enabled; 1: I ² C and MIPI I3C [®] interfaces disabled)

9.4 FIFO_CTRL1 (07h)

FIFO control register 1 (R/W)

Table 29. FIFO_CTRL1 register

WTM_7	WTM_6	WTM_5	WTM_4	WTM_3	WTM_2	WTM_1	WTM_0
-------	-------	-------	-------	-------	-------	-------	-------

-------------	------------------	------------------	------------	------------------	----------------	----------------	-------------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 32. FIFO_CTRL2 register description

STOP_ON_WTM	Sensing chain FIFO stop values memorization at threshold level. Default value: 0 (0: FIFO depth is not limited; 1: FIFO depth is limited to threshold level, defined in FIFO_CTRL1 (07h))
FIFO_COMPR_RT_EN ⁽¹⁾	Enables/disables compression algorithm runtime. Default value: 0 (0: FIFO compression algorithm disabled; 1: FIFO compression algorithm enabled)
ODR_CHG_EN	Enables ODR CHANGE virtual sensor to be batched in FIFO. Default value: 0 (0: ODR CHANGE virtual sensor not batched in FIFO; 1: ODR CHANGE virtual sensor batched in FIFO)
UNCOMPR_RATE_[1:0]	This field configures the compression algorithm to write uncompressed data at each rate. (0: uncompressed data writing is not forced (default); 1: uncompressed data every 8 batch data rate; 2: uncompressed data every 16 batch data rate; 3: uncompressed data every 32 batch data rate)
XL_DualC_BATCH_FROM_FSM	When dual-channel mode is enabled, this bit enables FSM-triggered batching in FIFO of accelerometer channel 2. Default value: 0 (0: disabled; 1: enabled)

1. This bit is active when the FIFO_COMPR_EN bit of [EMB_FUNC_EN_B \(05h\)](#) is set to 1.

9.6 FIFO_CTRL3 (09h)

FIFO control register 3 (R/W)

Table 33. FIFO_CTRL3 register

Table 34. FIFO_CTRL3 register description

BDR_GY_[3:0]	Selects batch data rate (write frequency in FIFO) for gyroscope data. (0000: gyroscope not batched in FIFO (default); 0001: 1.875 Hz; 0010: 7.5 Hz; 0011: 15 Hz; 0100: 30 Hz; 0101: 60 Hz; 0110: 120 Hz; 0111: 240 Hz; 1000: 480 Hz; 1001: 960 Hz; 1010: 1.92 kHz; 1011: 3.84 kHz; 1100: 7.68 kHz 1101-1111: reserved)
BDR_XL_[3:0]	Selects batch data rate (write frequency in FIFO) for accelerometer data. (0000: accelerometer not batched in FIFO (default); 0001: 1.875 Hz; 0010: 7.5 Hz; 0011: 15 Hz; 0100: 30 Hz; 0101: 60 Hz; 0110: 120 Hz; 0111: 240 Hz; 1000: 480 Hz; 1001: 960 Hz; 1010: 1.92 kHz; 1011: 3.84 kHz; 1100: 7.68 kHz 1101-1111: reserved)

9.7 FIFO_CTRL4 (0Ah)

FIFO control register 4 (R/W)

Table 35. FIFO_CTRL4 register

DEC_TS_BATCH_1	DEC_TS_BATCH_0	ODR_T_BATCH_1	ODR_T_BATCH_0	0 ⁽¹⁾	FIFO_MODE_2	FIFO_MODE_1	FIFO_MODE_0
----------------	----------------	---------------	---------------	------------------	-------------	-------------	-------------

1. This bit must be set to 0 for the correct operation of the device.

Table 36. FIFO_CTRL4 register description

DEC_TS_BATCH_[1:0]	Selects decimation for timestamp batching in FIFO. Write rate is the maximum rate between the accelerometer and gyroscope BDR divided by decimation decoder. (00: Timestamp not batched in FIFO (default); 01: decimation 1: max(BDR_XL[Hz],BDR_GY[Hz]) [Hz]; 10: decimation 8: max(BDR_XL[Hz],BDR_GY[Hz])/8 [Hz]; 11: decimation 32: max(BDR_XL[Hz],BDR_GY[Hz])/32 [Hz])
ODR_T_BATCH_[1:0]	Selects batch data rate (write frequency in FIFO) for temperature data (00: temperature not batched in FIFO (default); 01: 1.875 Hz; 10: 15 Hz; 11: 60 Hz)
FIFO_MODE_[2:0]	FIFO mode selection (000: bypass mode: FIFO disabled (default); 001: FIFO mode: stops collecting data when FIFO is full; 010: continuousWTM-to-full mode: continuous mode with FIFO watermark size until trigger is deasserted, then data are stored in FIFO until the buffer is full; 011: continuous-to-FIFO mode: continuous mode until trigger is deasserted, then FIFO mode; 100: bypass-to-continuous mode: bypass mode until trigger is deasserted, then continuous mode; 101: reserved; 110: continuous mode: if the FIFO is full, the new sample overwrites the older one; 111: bypass-to-FIFO mode: bypass mode until trigger is deasserted, then FIFO mode.)

9.8 COUNTER_BDR_REG1 (0Bh)

Counter batch data rate register 1 (R/W)

Table 37. COUNTER_BDR_REG1 register

0 ⁽¹⁾	TRIG_COUN TER_BDR_1	TRIG_COUN TER_BDR_0	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	CNT_ BDR_TH_9	CNT_ BDR_TH_8
------------------	------------------------	------------------------	------------------	------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 38. COUNTER_BDR_REG1 register description

TRIG_COUNTER_BDR_[1:0]	Selects the trigger for the internal counter of batch events between the accelerometer and gyroscope. (00: accelerometer batch event; 01: gyroscope batch event; 10 – 11: reserved)
CNT_BDR_TH_[9:8]	In conjunction with CNT_BDR_TH_[7:0] in COUNTER_BDR_REG2 (0Ch), sets the threshold for the internal counter of batch events. When this counter reaches the threshold, the counter is reset and the COUNTER_BDR_IA flag in FIFO_STATUS2 (1Ch) is set to 1.

9.9 COUNTER_BDR_REG2 (0Ch)

Counter batch data rate register 2 (R/W)

Table 39. COUNTER_BDR_REG2 register

CNT_ BDR_TH_7	CNT_ BDR_TH_6	CNT_ BDR_TH_5	CNT_ BDR_TH_4	CNT_ BDR_TH_3	CNT_ BDR_TH_2	CNT_ BDR_TH_1	CNT_ BDR_TH_0
------------------	------------------	------------------	------------------	------------------	------------------	------------------	------------------

Table 40. COUNTER_BDR_REG2 register description

CNT_BDR_TH_[7:0]	In conjunction with CNT_BDR_TH_[9:8] in COUNTER_BDR_REG1 (0Bh), sets the threshold for the internal counter of batch events. When this counter reaches the threshold, the counter is reset and the COUNTER_BDR_IA flag in FIFO_STATUS2 (1Ch) is set to 1.
------------------	---

9.10 INT1_CTRL (0Dh)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1 when the MIPI I3C® dynamic address is not assigned (I²C or SPI is used). Some bits can be also used to trigger an IBI (in-band interrupt) when the MIPI I3C® interface is used. The output of the pin is the OR combination of the signals selected here and in [MD1_CFG \(5Eh\)](#).

Table 41. INT1_CTRL register

0 ⁽¹⁾	INT1_CNT_BDR	INT1_FIFO_FULL	INT1_FIFO_OVR	INT1_FIFO_TH	0 ⁽¹⁾	INT1_DRDY_G	INT1_DRDY_XL
------------------	--------------	----------------	---------------	--------------	------------------	-------------	--------------

1. This bit must be set to 0 for the correct operation of the device.

Table 42. INT1_CTRL register description

INT1_CNT_BDR	Enables COUNTER_BDR_IA interrupt on INT1 pin. Default value: 0
INT1_FIFO_FULL	Enables FIFO full flag interrupt on INT1 pin. It can be also used to trigger an IBI when the MIPI I3C® interface is used. Default value: 0
INT1_FIFO_OVR	Enables FIFO overrun interrupt on INT1 pin. It can be also used to trigger an IBI when the MIPI I3C® interface is used. Default value: 0
INT1_FIFO_TH	Enables FIFO threshold interrupt on INT1 pin. It can be also used to trigger an IBI when the MIPI I3C® interface is used. Default value: 0
INT1_DRDY_G	Enables gyroscope data-ready interrupt on INT1 pin. It can be also used to trigger an IBI when the MIPI I3C® interface is used. Default value: 0
INT1_DRDY_XL	Enables accelerometer data-ready interrupt on INT1 pin. It can be also used to trigger an IBI when the MIPI I3C® interface is used. Default value: 0

9.11 INT2_CTRL (0Eh)

INT2 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT2 when the MIPI I3C® dynamic address is not assigned (I²C or SPI is used). Some bits can be also used to trigger an IBI when the MIPI I3C® interface is used. The output of the pin is the OR combination of the signals selected here and in [MD2_CFG \(5Fh\)](#).

Table 43. INT2_CTRL register

INT2_EMB_FUNC_ENDOP	INT2_CNT_BDR	INT2_FIFO_FULL	INT2_FIFO_OVR	INT2_FIFO_TH	0 ⁽¹⁾	INT2_DRDY_G	INT2_DRDY_XL
---------------------	--------------	----------------	---------------	--------------	------------------	-------------	--------------

1. This bit must be set to 0 for the correct operation of the device.

Table 44. INT2_CTRL register description

INT2_EMB_FUNC_ENDOP	Enables routing the embedded functions end of operations signal to the INT2 pin. Default value: 0
INT2_CNT_BDR	Enables COUNTER_BDR_IA interrupt on INT2. Default value: 0
INT2_FIFO_FULL	Enables FIFO full flag interrupt on INT2 pin. Default value: 0
INT2_FIFO_OVR	Enables FIFO overrun interrupt on INT2 pin. Default value: 0
INT2_FIFO_TH	Enables FIFO threshold interrupt on INT2 pin. Default value: 0
INT2_DRDY_G	Gyroscope data-ready interrupt on INT2 pin. Default value: 0
INT2_DRDY_XL	Accelerometer data-ready interrupt on INT2 pin. Default value: 0

9.12 WHO_AM_I (0Fh)

WHO_AM_I register (R). This is a read-only register. Its value is fixed at 71h.

			100	ODR/100
			101	ODR/200
			110	ODR/400
			111	ODR/800

1. This value is ODR/2 when the accelerometer is in high-performance mode. It is equal to 3100 Hz when the accelerometer is in low-power mode 1 (2 mean), 912 Hz in low-power mode 2 (4 mean) and 431 Hz in low-power mode 3 (8 mean).

9.21 CTRL9 (18h)

Control register 9 (R/W)

Table 66. CTRL9 register

0 ⁽¹⁾	HP_REF_MODE_XL	XL_FASTSETTL_MODE	HP_SLOPE_XL_EN	LPF2_XL_EN	0 ⁽¹⁾	USR_OFF_W	USR_OFF_ON_OUT
------------------	----------------	-------------------	----------------	------------	------------------	-----------	----------------

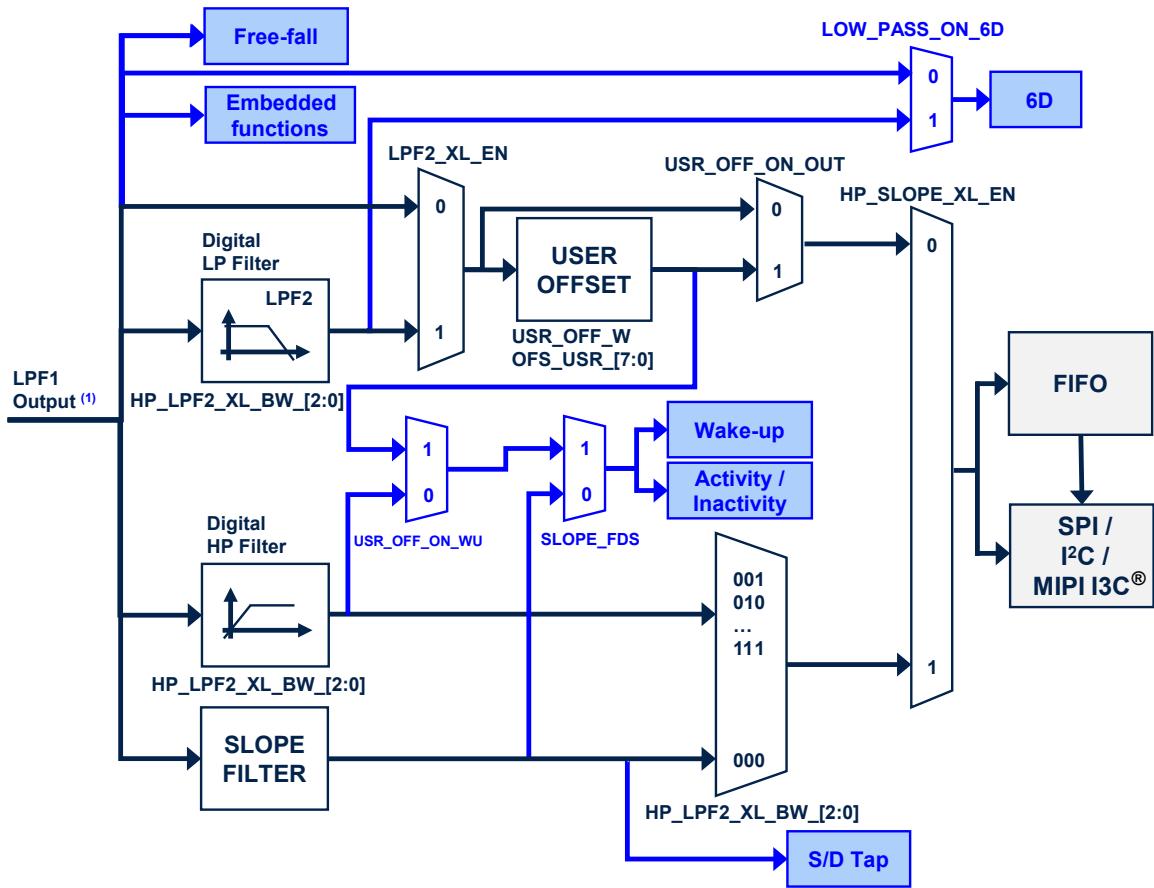

1. This bit must be set to 0 for the correct operation of the device.

Table 67. CTRL9 register description

HP_REF_MODE_XL	Enables accelerometer high-pass filter reference mode (valid for high-pass path - HP_SLOPE_XL_EN bit must be 1). Default value: 0 (0: disabled, 1: enabled) ⁽¹⁾
XL_FASTSETTL_MODE	Enables accelerometer LPF2 and HPF fast-settling mode. The filter sets the first sample after writing this bit. Active only during device exit from power-down mode. Default value: 0 (0: disabled, 1: enabled)
HP_SLOPE_XL_EN	Accelerometer slope filter / high-pass filter selection. Refer to Figure 28. Default value: 0 (0: low-pass filter path selected; 1: high-pass filter path selected)
LPF2_XL_EN	Accelerometer high-resolution selection. Refer to Figure 28. Default value: 0 (0: output from first stage digital filtering selected; 1: output from LPF2 second filtering stage selected)
USR_OFF_W	Weight of XL user offset bits of registers Z_OFS_USR (73h), Y_OFS_USR (74h), X_OFS_USR (75h). Default value: 0 (0: 2 ⁻¹⁰ g/LSB; 1: 2 ⁻⁶ g/LSB)
USR_OFF_ON_OUT	Enables the accelerometer user offset correction block; it is valid for the low-pass path. Refer to Figure 28. Default value: 0 (0: accelerometer user offset correction block bypassed; 1: accelerometer user offset correction block enabled)

1. When enabled, the first output data has to be discarded.

Figure 28. Accelerometer block diagram

1. The cutoff value of the LPF1 output is ODR/2 when the accelerometer is in high-performance mode. This value is equal to 3100 Hz when the accelerometer is in low-power mode 1 (2 mean), 912 Hz in low-power mode 2 (4 mean) or 431 Hz in low-power mode 3 (8 mean).

-------------	-------------	--------------	----------------	------------------	---	---	-------------

Table 75. FIFO_STATUS2 register description

FIFO_WTM_IA	FIFO watermark status. Default value: 0 (0: FIFO filling is lower than WTM; 1: FIFO filling is equal to or greater than WTM) Watermark is set through bits WTM[7:0] in FIFO_CTRL1 (07h).
FIFO_OVR_IA	FIFO overrun status. Default value: 0 (0: FIFO is not completely filled; 1: FIFO is completely filled)
FIFO_FULL_IA	Smart FIFO full status. Default value: 0 (0: FIFO is not full; 1: FIFO will be full at the next ODR)
COUNTER_BDR_IA	Counter BDR reaches the CNT_BDR_TH_[10:0] threshold set in COUNTER_BDR_REG1 (0Bh) and COUNTER_BDR_REG2 (0Ch). Default value: 0 This bit is reset when these registers are read.
FIFO_OVR_LATCHED	Latched FIFO overrun status. Default value: 0 This bit is reset when this register is read.
DIFF_FIFO_8	Number of unread sensor data (TAG + 6 bytes) stored in FIFO. Default value: 00 In conjunction with DIFF_FIFO[7:0] in FIFO_STATUS1 (1Bh)

9.26 ALL_INT_SRC (1Dh)

Source register for all interrupts (R)

Table 76. ALL_INT_SRC register

EMB_FUNC_IA	0	SLEEP_CHANGE_IA	D6D_IA	0	TAP_IA	WU_IA	FF_IA
-------------	---	-----------------	--------	---	--------	-------	-------

Table 77. ALL_INT_SRC register description

EMB_FUNC_IA	Embedded functions interrupt status. Default value: 0 (0: embedded functions event not detected; 1: embedded functions event detected)
SLEEP_CHANGE_IA	Detects change event in activity/inactivity status. Default value: 0 (0: change status not detected; 1: change status detected)
D6D_IA	Interrupt active for change in position of portrait, landscape, face-up, face-down. Default value: 0 (0: change in position not detected; 1: change in position detected)
TAP_IA	Single or double-tap event detection status depending on SINGLE_DOUBLE_TAP_bit value (see WAKE_UP_THS (5Bh) register). Default value: 0 (0: tap event not detected; 1: tap event detected)
WU_IA	Wake-up event status. Default value: 0 (0: event not detected, 1: event detected)
FF_IA	Free-fall event status. Default value: 0 (0: event not detected, 1: event detected)

9.27 STATUS_REG (1Eh)

The STATUS_REG register is read by the primary interface SPI/I²C & MIPI I3C® (R).

Table 78. STATUS_REG register

9.44 INTERNAL_FREQ_FINE (4Fh)

Internal frequency register (R)

Table 122. INTERNAL_FREQ_FINE register

FREQ_FINE_7	FREQ_FINE_6	FREQ_FINE_5	FREQ_FINE_4	FREQ_FINE_3	FREQ_FINE_2	FREQ_FINE_1	FREQ_FINE_0
-------------	-------------	-------------	-------------	-------------	-------------	-------------	-------------

Table 123. INTERNAL_FREQ_FINE register description

FREQ_FINE_[7:0]	Difference in percentage of the effective ODR (and timestamp rate) with respect to the typical. Step: 0.13%. 8-bit format, two's complement.
-----------------	---

The actual timestamp resolution and the actual output data rate can be calculated using the following formulas:

$$t_{actual}[s] = \frac{1}{46080 \cdot (1 + 0.0013 \cdot FREQ_FINE)}$$

$$ODR_{actual}[Hz] = \frac{7680 \cdot (1 + 0.0013 \cdot FREQ_FINE)}{ODR_{coeff}}$$

Table 124. ODRcoeff values

Selected ODR [Hz]	ODRcoeff
7.5	1024
15	512
30	256
60	128
120	64
240	32
480	16
960	8
1.92 kHz	4
3.84 kHz	2
7.68 kHz	1

9.45 FUNCTIONS_ENABLE (50h)

Enable interrupt functions register (R/W)

Table 125. FUNCTIONS_ENABLE register

INTERRUPTS_ENABLE	TIMESTAMP_EN	0 ⁽¹⁾	0 ⁽¹⁾	DIS_RST_LIR_ALL_INT	0 ⁽¹⁾	INACT_EN_1	INACT_EN_0
-------------------	--------------	------------------	------------------	---------------------	------------------	------------	------------

1. This bit must be set to 0 for the correct operation of the device.

Table 126. FUNCTIONS_ENABLE register description

INTERRUPTS_ENABLE	Enables basic interrupts (6D, free-fall, wake-up, tap, activity/inactivity). Default value: 0 (0: interrupt disabled; 1: interrupt enabled)
TIMESTAMP_EN	Enables timestamp counter. The counter is readable in TIMESTAMP0 (40h) , TIMESTAMP1 (41h) , TIMESTAMP2 (42h) , and TIMESTAMP3 (43h) . Default value: 0 (0: disabled; 1: enabled)
DIS_RST_LIR_ALL_INT	When this bit is set to 1, reading the ALL_INT_SRC (1Dh) register does not reset the latched interrupt signals. This can be useful in order to not reset some status flags before reading the corresponding status register. Default value: 0 (0: disabled; 1: enabled)
INACT_EN_[1:0]	Enables activity/inactivity (sleep) function. Default value: 00 (00: stationary/motion-only interrupts generated, accelerometer and gyroscope configuration do not change; 01: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope configuration does not change; 10: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope in sleep mode; 11: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope in power-down mode)

9.46 INACTIVITY_DUR (54h)

Activity/inactivity configuration register (R/W)

Table 127. INACTIVITY_DUR register

SLEEP_STATUS_ON_INT	WU_INACT_THS_W_2	WU_INACT_THS_W_1	WU_INACT_THS_W_0	XL_INACT_ODR_1	XL_INACT_ODR_0	INACT_DUR_1	INACT_DUR_0
---------------------	------------------	------------------	------------------	----------------	----------------	-------------	-------------

Table 128. INACTIVITY_DUR register description

SLEEP_STATUS_ON_INT	Activity/inactivity interrupt mode configuration. If the INT1_SLEEP_CHANGE or INT2_SLEEP_CHANGE bit is enabled, drives the sleep status or sleep change on the INT pin. Default value: 0 (0: sleep change notification on INT pin; 1: sleep status reported on INT pin)
WU_INACT_THS_W_[2:0]	Weight of 1 LSB of wake-up (WU_THS) and activity/inactivity (INACT_THS) threshold. (000: 7.8125 mg/LSB (default); 001: 15.625 mg/LSB; 010: 31.25 mg/LSB; 011: 62.5 mg/LSB; 100: 125 mg/LSB; 101 - 110 - 111: 250 mg/LSB)
XL_INACT_ODR_[1:0]	Selects the ODR_XL target during inactivity. (00: 1.875 Hz; 01: 15 Hz (default); 10: 30 Hz; 11: 60 Hz)
INACT_DUR_[1:0]	Duration in the transition from stationary to motion (from inactivity to activity). (00: transition to motion (activity) immediately at first overthreshold event (default); 01: transition to motion (activity) after two consecutive overthreshold events; 10: transition to motion (activity) after three consecutive overthreshold events; 11: transition to motion (activity) after four consecutive overthreshold events)

9.47 INACTIVITY_THS (55h)

Activity/inactivity threshold setting register (R/W)

Table 129. INACTIVITY_THS register

0 ⁽¹⁾	0 ⁽¹⁾	INACT_THS_5	INACT_THS_4	INACT_THS_3	INACT_THS_2	INACT_THS_1	INACT_THS_0
------------------	------------------	-------------	-------------	-------------	-------------	-------------	-------------

1. This bit must be set to 0 for the correct operation of the device.

Table 130. INACTIVITY_THS register description

INACT_THS_[5:0]	Activity/inactivity threshold. The resolution of the threshold depends on the value of WU_INACT_THS_W_[2:0] in the INACTIVITY_DUR (54h) register. Default value: 000000
-----------------	---

9.48 TAP_CFG0 (56h)

Tap configuration register 0 (R/W)

Table 131. TAP_CFG0 register

0 ⁽¹⁾	LOW_PASS_ON_6D	HW_FUNC_MASK_XL_SETTL	SLOPE_FDS	TAP_Z_EN	TAP_Y_EN	TAP_X_EN	LIR
------------------	----------------	-----------------------	-----------	----------	----------	----------	-----

1. This bit must be set to 0 for the correct operation of the device.

Table 132. TAP_CFG0 register description

LOW_PASS_ON_6D	LPF2 filter on 6D function selection. Refer to Figure 28. Default value: 0 (0: ODR/2 low-pass filtered data sent to 6D interrupt function; 1: LPF2 output data sent to 6D interrupt function)
HW_FUNC_MASK_XL_SETTL	Enables masking the execution trigger of the basic interrupt functions (6D, free-fall, wake-up, tap, activity/inactivity) when accelerometer data are settling. Default value: 0 (0: disabled; 1: enabled)
SLOPE_FDS	HPF or slope filter selection on wake-up and activity/inactivity functions. Refer to Figure 28. Default value: 0 (0: slope filter applied; 1: HPF applied)
TAP_Z_EN	Enables Z direction in tap recognition. If the Z-axis is disabled, this bit must be set to 0. Default value: 0 (0: Z direction disabled; 1: Z direction enabled)
TAP_Y_EN	Enables Y direction in tap recognition. If the Y-axis is disabled, this bit must be set to 0. Default value: 0 (0: Y direction disabled; 1: Y direction enabled)
TAP_X_EN	Enables X direction in tap recognition. If the X-axis is disabled, this bit must be set to 0. Default value: 0 (0: X direction disabled; 1: X direction enabled)
LIR	Latched interrupt. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)

9.49 TAP_CFG1 (57h)

Tap configuration register 1 (R/W)

Table 133. TAP_CFG1 register

TAP_PRIORITY_2	TAP_PRIORITY_1	TAP_PRIORITY_0	TAP_THS_Z_4	TAP_THS_Z_3	TAP_THS_Z_2	TAP_THS_Z_1	TAP_THS_Z_0

1. This bit must be set to 0 for the correct operation of the device.

Table 139. TAP_THS_6D register description

SIXD_THS_[1:0]	Threshold for 6D function. Default value: 00 For details, refer to Table 140 .
TAP_THS_X_[4:0]	X-axis recognition threshold. Default value: 0 1 LSB = FS_XL / (2 ⁵)

Table 140. Threshold for D6D function

SIXD_THS_[1:0]	Threshold value
00	80 degrees
01	70 degrees
10	60 degrees
11	50 degrees

9.52 TAP_DUR (5Ah)

Tap recognition function setting register (R/W)

Table 141. TAP_DUR register

DUR_3	DUR_2	DUR_1	DUR_0	QUIET_1	QUIET_0	SHOCK_1	SHOCK_0
-------	-------	-------	-------	---------	---------	---------	---------

Table 142. TAP_DUR register description

DUR_[3:0]	Duration of maximum time gap for double tap recognition. Default: 0000 When double-tap recognition is enabled, this register expresses the maximum time between two consecutive detected taps to determine a double-tap event. The default value of these bits is 0000b which corresponds to 16/ODR_XL time. If the DUR_[3:0] bits are set to a different value, 1LSB corresponds to 32/ODR_XL time.
QUIET_[1:0]	Expected quiet time after a tap detection. Default value: 00 Quiet time is the time after the first detected tap in which there must not be any overthreshold event. The default value of these bits is 00b which corresponds to 2/ODR_XL time. If the QUIET_[1:0] bits are set to a different value, 1LSB corresponds to 4/ODR_XL time.
SHOCK_[1:0]	Maximum duration of overthreshold event. Default value: 00 Maximum duration is the maximum time of an overthreshold signal detection to be recognized as a tap event. The default value of these bits is 00b which corresponds to 4/ODR_XL time. If the SHOCK_[1:0] bits are set to a different value, 1LSB corresponds to 8/ODR_XL time.

9.53 WAKE_UP_THS (5Bh)

Single/double-tap selection and wake-up configuration (R/W)

Table 143. WAKE_UP_THS register

SINGLE_DOUBLE_TAP	USR_OFF_ON_WU	WK_THS_5	WK_THS_4	WK_THS_3	WK_THS_2	WK_THS_1	WK_THS_0
-------------------	---------------	----------	----------	----------	----------	----------	----------

Table 144. WAKE_UP_THS register description

SINGLE_DOUBLE_TAP	Enables single/double-tap event. Default value: 0 (0: only single-tap event enabled; 1: both single and double-tap events enabled)
USR_OFF_ON_WU	Drives the low-pass filtered data with user offset correction (instead of high-pass filtered data) to the wake-up and the activity/inactivity functions. Refer to Figure 28. Default value: 0
WK_THS_[5:0]	Wake-up threshold. The resolution of the threshold depends on the value of WU_INACT_THS_W_[2:0] in the INACTIVITY_DUR (54h) register. Default value: 000000

9.54 WAKE_UP_DUR (5Ch)

Free-fall, wake-up, and sleep mode functions duration setting register (R/W)

Table 145. WAKE_UP_DUR register

FF_DUR_5	WAKE_DUR_1	WAKE_DUR_0	0 ⁽¹⁾	SLEEP_DUR_3	SLEEP_DUR_2	SLEEP_DUR_1	SLEEP_DUR_0
----------	------------	------------	------------------	-------------	-------------	-------------	-------------

1. This bit must be set to 0 for the correct operation of the device.

Table 146. WAKE_UP_DUR register description

FF_DUR_5	Free-fall duration event. Default: 0 For the complete configuration of the free-fall duration, refer to FF_DUR_[4:0] in the FREE_FALL (5Dh) configuration. 1 LSB = 1/ODR_XL time
WAKE_DUR_[1:0]	Wake-up duration event. Default: 00 1 LSB = 1/ODR_XL time
SLEEP_DUR_[3:0]	Duration to go in sleep mode. Default value: 0000 (this corresponds to 16 ODR) 1 LSB = 512/ODR_XL time

9.55 FREE_FALL (5Dh)

Free-fall function duration setting register (R/W)

Table 147. FREE_FALL register

FF_DUR_4	FF_DUR_3	FF_DUR_2	FF_DUR_1	FF_DUR_0	FF_THS_2	FF_THS_1	FF_THS_0
----------	----------	----------	----------	----------	----------	----------	----------

Table 148. FREE_FALL register description

FF_DUR_[4:0]	Free-fall duration event. Default: 0 For the complete configuration of the free-fall duration, refer to FF_DUR_5 in the WAKE_UP_DUR (5Ch) configuration.
FF_THS_[2:0]	Free-fall threshold setting. Default: 000 For details refer to Table 149.

Table 149. Threshold for free-fall function

FF_THS_[2:0]	Threshold value
000	156 mg
001	219 mg
010	250 mg
011	312 mg
100	344 mg
101	406 mg
110	469 mg
111	500 mg

9.56 MD1_CFG (5Eh)

Functions routing to INT1 pin register (R/W). Each bit in this register enables a signal to be carried over the INT1 pin. The output of the pin is the OR combination of the signals selected here and in the [INT1_CTRL \(0Dh\)](#) register.

Table 150. MD1_CFG register

INT1_SLEEP_CHANGE	INT1_SINGLE_TAP	INT1_WU	INT1_FF	INT1_DOUBLE_TAP	INT1_6D	INT1_EMB_FUNC	0 ⁽¹⁾
-------------------	-----------------	---------	---------	-----------------	---------	---------------	------------------

1. *This bit must be set to 0 for the correct operation of the device.*

Table 151. MD1_CFG register description

INT1_SLEEP_CHANGE ⁽¹⁾	Routing activity/inactivity recognition event to INT1. Default: 0 (0: routing activity/inactivity event to INT1 disabled; 1: routing activity/inactivity event to INT1 enabled)
INT1_SINGLE_TAP	Routing single-tap recognition event to INT1. Default: 0 (0: routing single-tap event to INT1 disabled; 1: routing single-tap event to INT1 enabled)
INT1_WU	Routing wake-up event to INT1. Default value: 0 (0: routing wake-up event to INT1 disabled; 1: routing wake-up event to INT1 enabled)
INT1_FF	Routing free-fall event to INT1. Default value: 0 (0: routing free-fall event to INT1 disabled; 1: routing free-fall event to INT1 enabled)
INT1_DOUBLE_TAP	Routing tap event to INT1. Default value: 0 (0: routing double-tap event to INT1 disabled; 1: routing double-tap event to INT1 enabled)
INT1_6D	Routing 6D event to INT1. Default value: 0 (0: routing 6D event to INT1 disabled; 1: routing 6D event to INT1 enabled)
INT1_EMB_FUNC	Routing embedded functions event to INT1. Default value: 0 (0: routing embedded functions event to INT1 disabled; 1: routing embedded functions event to INT1 enabled)

1. *Activity/inactivity interrupt mode (sleep change or sleep status) depends on the SLEEP_STATUS_ON_INT bit in the [INACTIVITY_DUR \(54h\)](#) register.*

9.57

MD2_CFG (5Fh)

Functions routing to INT2 pin register (R/W). Each bit in this register enables a signal to be carried over the INT1 pin. The output of the pin is the OR combination of the signals selected here and in the [INT2_CTRL \(0Eh\)](#) register.

Table 152. MD2_CFG register

INT2_SLEEP_CHANGE	INT2_SINGLE_TAP	INT2_WU	INT2_FF	INT2_DOUBLE_TAP	INT2_6D	INT2_EMB_FUNC	INT2_TIMESTAMP
-------------------	-----------------	---------	---------	-----------------	---------	---------------	----------------

Table 153. MD2_CFG register description

INT2_SLEEP_CHANGE ⁽¹⁾	Routing activity/inactivity recognition event to INT2. Default: 0 (0: routing activity/inactivity event to INT2 disabled; 1: routing activity/inactivity event to INT2 enabled)
INT2_SINGLE_TAP	Single-tap recognition routing to INT2. Default: 0 (0: routing single-tap event to INT2 disabled; 1: routing single-tap event to INT2 enabled)
INT2_WU	Routing wake-up event to INT2. Default value: 0 (0: routing wake-up event to INT2 disabled; 1: routing wake-up event to INT2 enabled)
INT2_FF	Routing free-fall event to INT2. Default value: 0 (0: routing free-fall event to INT2 disabled; 1: routing free-fall event to INT2 enabled)
INT2_DOUBLE_TAP	Routing tap event to INT2. Default value: 0 (0: routing double-tap event to INT2 disabled; 1: routing double-tap event to INT2 enabled)
INT2_6D	Routing 6D event to INT2. Default value: 0 (0: routing 6D event to INT2 disabled; 1: routing 6D event to INT2 enabled)
INT2_EMB_FUNC	Routing embedded functions event to INT2. Default value: 0 (0: routing embedded functions event to INT2 disabled; 1: routing embedded functions event to INT2 enabled)
INT2_TIMESTAMP	Enables routing the alert for timestamp overflow within 5.6 ms to the INT2 pin.

1. Activity/inactivity interrupt mode (sleep change or sleep status) depends on the [SLEEP_STATUS_ON_INT](#) bit in the [INACTIVITY_DUR \(54h\)](#) register.

9.58 EMB_FUNC_CFG (63h)

Embedded functions configuration register (R/W)

Table 154. EMB_FUNC_CFG register

XL_DualC_BATCH_FROM_IF	0 ⁽¹⁾	EMB_FUNC_IRQ_MASK_G_SETTL	EMB_FUNC_IRQ_MASK_XL_SETTL	EMB_FUNC_DISABLE	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾
------------------------	------------------	---------------------------	----------------------------	------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 155. EMB_FUNC_CFG register description

XL_DualC_BATCH_FROM_IF	When dual-channel mode is enabled, this bit enables batching the accelerometer channel 2 in FIFO. Default value: 0 (0: disabled; 1: enabled)
EMB_FUNC_IRQ_MASK_G_SETTL	Enables / masks execution trigger of the embedded functions when gyroscope data are settling. Default value: 0 (0: disabled; 1: masks execution trigger of the embedded functions until gyroscope filter settling ends)
EMB_FUNC_IRQ_MASK_XL_SETTL	Enables / masks execution trigger of the embedded functions when accelerometer data are settling. Default value: 0 (0: disabled; 1: masks execution trigger of the embedded functions until accelerometer filter settling ends)
EMB_FUNC_DISABLE	Disables execution of the embedded functions. Default value: 0 (0: disabled; 1: embedded functions execution trigger is not generated anymore and all initialization procedures are forced when this bit is set back to 0).

9.59 TDM_CFG0 (6Ch)

TDM configuration register 0 (R/W)

Table 156. TDM_CFG0 register

1 ⁽¹⁾	TDM_DELAYED_CFG	TDM_BCLK_EDGE_SEL	TDM_SLOT_SEL	0 ⁽²⁾	TDM_WCLK_1	TDM_WCLK_0	TDM_WCLK_BCLK_SEL
------------------	-----------------	-------------------	--------------	------------------	------------	------------	-------------------

1. This bit must be set to 1 for the correct operation of the device.
2. This bit must be set to 0 for the correct operation of the device.

Table 157. TDM_CFG0 register description

TDM_DELAYED_CFG	Enables TDM delayed configuration. Default value: 0 (0: disabled; 1: enabled)
TDM_BCLK_EDGE_SEL	BCLK edge selection for TDM interface. Default value: 0 (0: sampling on BCLK rising edge; 1: sampling on BCLK falling edge)
TDM_SLOT_SEL	Selection of TDM slot for transmission. Default value: 0 (0: slot {0, 1, 2} is selected; 1: slot {4, 5, 6} is selected)
TDM_WCLK_[1:0]	TDM word clock frequency selection (see Table 158)
TDM_WCLK_BCLK_SEL	Selection of cross association between WCLK and BCLK frequencies (see Table 158)

Table 158. WCLK and BCLK frequencies

TDM_WCLK_[1:0]	TDM_WCLK_BCLK_SEL	WCLK	BCLK
01	0	16 kHz	2048 kHz
00	1	8 kHz	2048 kHz

9.60 TDM_CFG1 (6Dh)

TDM configuration register 1 (R/W)

Table 159. TDM_CFG1 register

TDM_XL_X_EN	TDM_XL_Y_EN	TDM_XL_Z_EN	TDM_AXES_ORD_SEL_1	TDM_AXES_ORD_SEL_0	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾
-------------	-------------	-------------	--------------------	--------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 160. TDM_CFG1 register description

TDM_XL_X_EN	Enables accelerometer X-axis elaboration and transmission (acts on both UI and TDM side). Disabling the X-axis can be done only during the initialization phase, while the accelerometer is in power-down mode and before turning on the accelerometer. The disabling of any axis is not compatible with the free-fall, 6D, or SFLP features and could impact the behavior and performance of the other advanced functions also. Default value: 1 (0: disabled; 1: enabled)
TDM_XL_Y_EN	Enables accelerometer Y-axis elaboration and transmission (acts on both UI and TDM side). Disabling the Y-axis can be done only during the initialization phase, while the accelerometer is in power-down mode and before turning on the accelerometer. The disabling of any axis is not compatible with the free-fall, 6D, or SFLP features and could impact the behavior and performance of the other advanced functions also. Default value: 1 (0: disabled; 1: enabled)
TDM_XL_Z_EN	Enables accelerometer Z-axis elaboration and transmission (acts on both UI and TDM side). Disabling the Z-axis can be done only during the initialization phase, while the accelerometer is in power-down mode and before turning on the accelerometer. The disabling of any axis is not compatible with the free-fall, 6D, or SFLP features and could impact the behavior and performance of the other advanced functions also. Default value: 1 (0: disabled; 1: enabled)
TDM_AXES_ORD_SEL_[1:0]	Selects the order of transmission of the TDM axes (see Table 161)

Table 161. Selection of order of transmission of TDM axes

TDM_AXES_ORD_SEL_[1:0]	Order of axes
00	Z, Y, X
01	X, Z, Y
10	X, Y, Z

9.61 TDM_CFG2 (6Eh)

TDM configuration register 2 (R/W)

Table 162. TDM_CFG2 register

0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	TDM_DATA_MASK	0 ⁽¹⁾	TDM_FS_XL_1	TDM_FS_XL_0
------------------	------------------	------------------	------------------	---------------	------------------	-------------	-------------

1. This bit must be set to 0 for the correct operation of the device.

Table 163. TDM_CFG2 register description

TDM_DATA_MASK	TDM outputs exception code (0x8000) until data is settled. Default value: 0 (0: disabled; 1: enabled)
TDM_FS_XL_[1:0]	TDM channel accelerometer full-scale selection: (00: ±2 g; 01: ±4 g (default); 10: ±8 g)

9.62 Z_OFS_USR (73h)

Accelerometer Z-axis user offset correction (R/W). The offset value set in the Z_OFS_USR offset register is internally subtracted from the acceleration value measured on the Z-axis.

Table 164. Z_OFS_USR register

Z_OFS_USR_7	Z_OFS_USR_6	Z_OFS_USR_5	Z_OFS_USR_4	Z_OFS_USR_3	Z_OFS_USR_2	Z_OFS_USR_1	Z_OFS_USR_0
-------------	-------------	-------------	-------------	-------------	-------------	-------------	-------------

Table 165. Z_OFS_USR register description

Z_OFS_USR_[7:0]	Accelerometer Z-axis user offset correction expressed in two's complement, weight depends on USR_OFF_W in CTRL9 (18h) . The offset can be applied to the output registers (see USR_OFF_ON_OUT bit in the CTRL9 (18h) register) or to the wakeup function input data (see USR_OFF_ON_WU bit in the WAKE_UP_THS (5Bh) register). The value must be in the range [-127 127].
-----------------	---

9.63 Y_OFS_USR (74h)

Accelerometer Y-axis user offset correction (R/W). The offset value set in the Y_OFS_USR offset register is internally subtracted from the acceleration value measured on the Y-axis.

Table 166. Y_OFS_USR register

Y_OFS_USR_7	Y_OFS_USR_6	Y_OFS_USR_5	Y_OFS_USR_4	Y_OFS_USR_3	Y_OFS_USR_2	Y_OFS_USR_1	Y_OFS_USR_0
-------------	-------------	-------------	-------------	-------------	-------------	-------------	-------------

Table 167. Y_OFS_USR register description

Y_OFS_USR_[7:0]	Accelerometer Y-axis user offset correction expressed in two's complement, weight depends on USR_OFF_W in CTRL9 (18h) . The offset can be applied to the output registers (see USR_OFF_ON_OUT bit in the CTRL9 (18h) register) or to the wakeup function input data (see USR_OFF_ON_WU bit in the WAKE_UP_THS (5Bh) register). The value must be in the range [-127 127].
-----------------	---

9.64 X_OFS_USR (75h)

Accelerometer X-axis user offset correction (R/W). The offset value set in the X_OFS_USR offset register is internally subtracted from the acceleration value measured on the X-axis.

Table 168. X_OFS_USR register

X_OFS_USR_7	X_OFS_USR_6	X_OFS_USR_5	X_OFS_USR_4	X_OFS_USR_3	X_OFS_USR_2	X_OFS_USR_1	X_OFS_USR_0
-------------	-------------	-------------	-------------	-------------	-------------	-------------	-------------

Table 169. X_OFS_USR register description

X_OFS_USR_[7:0]	Accelerometer X-axis user offset correction expressed in two's complement, weight depends on USR_OFF_W in CTRL9 (18h) . The offset can be applied to the output registers (see USR_OFF_ON_OUT bit in the CTRL9 (18h) register) or to the wakeup function input data (see USR_OFF_ON_WU bit in the WAKE_UP_THS (5Bh) register). The value must be in the range [-127 127].
-----------------	---

9.65 FIFO_DATA_OUT_TAG (78h)

FIFO tag register (R)

Table 170. FIFO_DATA_OUT_TAG register

TAG_SENSOR_4	TAG_SENSOR_3	TAG_SENSOR_2	TAG_SENSOR_1	TAG_SENSOR_0	TAG_CNT_1	TAG_CNT_0	-
--------------	--------------	--------------	--------------	--------------	-----------	-----------	---

Table 171. FIFO_DATA_OUT_TAG register description

TAG_SENSOR_[4:0]	FIFO tag. Identifies the sensor in: FIFO_DATA_OUT_BYTE_0 (79h) and FIFO_DATA_OUT_BYTE_1 (7Ah) , FIFO_DATA_OUT_BYTE_2 (7Bh) and FIFO_DATA_OUT_BYTE_3 (7Ch) , and FIFO_DATA_OUT_BYTE_4 (7Dh) and FIFO_DATA_OUT_BYTE_5 (7Eh) For details, refer to Table 172.
TAG_CNT_[1:0]	2-bit counter which identifies sensor time slot

Table 172. FIFO tag

TAG_SENSOR_[4:0]	Sensor name
0x00	FIFO empty
0x01	Gyroscope NC ⁽¹⁾
0x02	Accelerometer NC ⁽²⁾
0x03	Temperature
0x04	Timestamp
0x05	CFG_Change
0x06	Accelerometer NC_T_2 ⁽²⁾
0x07	Accelerometer NC_T_1 ⁽²⁾
0x08	Accelerometer 2xC ⁽²⁾
0x09	Accelerometer 3xC ⁽²⁾
0x0A	Gyroscope NC_T_2 ⁽¹⁾
0x0B	Gyroscope NC_T_1 ⁽¹⁾
0x0C	Gyroscope 2xC ⁽¹⁾
0x0D	Gyroscope 3xC ⁽¹⁾
0x12	Step counter
0x13	SFLP game rotation vector
0x16	SFLP gyroscope bias
0x17	SFLP gravity vector
0x1D	Accelerometer DualC ⁽²⁾

1. Gyroscope data are stored in FIFO in the order of the X, Y, Z axes.

2. Accelerometer data are stored in FIFO in the order of the Z, Y, X axes.

9.66 FIFO_DATA_OUT_BYTE_0 (79h) and FIFO_DATA_OUT_BYTE_1 (7Ah)

FIFO data output (R)

FIFO provides 6 bytes output, starting from byte 0 up to byte 5.

Table 173. FIFO_DATA_OUT_BYTE_1 and FIFO_DATA_OUT_BYTE_0 registers

D15	D14	D13	D12	D11	D10	D9	D8

EMB_FUNC_INIT_B	R/W	67	01100111	00000000	

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

11 Embedded functions register description

11.1 PAGE_SEL (02h)

Enable advanced features dedicated page (R/W)

Table 180. PAGE_SEL register

PAGE_SEL3	PAGE_SEL2	PAGE_SEL1	PAGE_SEL0	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	1 ⁽²⁾
-----------	-----------	-----------	-----------	------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

2. This bit must be set to 1 for the correct operation of the device.

Table 181. PAGE_SEL register description

PAGE_SEL[3:0]	Selects the advanced features dedicated page. Default value: 0000
---------------	---

11.2 EMB_FUNC_EN_A (04h)

Enable embedded functions register (R/W)

Table 182. EMB_FUNC_EN_A register

0 ⁽¹⁾	0 ⁽¹⁾	SIGN_MOTION_EN	TILT_EN	PEDO_EN	0 ⁽¹⁾	SFLP_GAME_EN	0 ⁽¹⁾
------------------	------------------	----------------	---------	---------	------------------	--------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 183. EMB_FUNC_EN_A register description

SIGN_MOTION_EN	Enables significant motion detection function. Default value: 0 (0: significant motion detection function disabled; 1: significant motion detection function enabled)
TILT_EN	Enables tilt calculation. Default value: 0 (0: tilt algorithm disabled; 1: tilt algorithm enabled)
PEDO_EN	Enables pedometer algorithm. Default value: 0 (0: pedometer algorithm disabled; 1: pedometer algorithm enabled)
SFLP_GAME_EN	Enables sensor fusion low-power algorithm for 6-axis (accelerometer + gyroscope) game rotation vector. Default value: 0 (0: sensor fusion algorithm for 6-axis accelerometer + gyroscope disabled; 1: sensor fusion algorithm for 6-axis accelerometer + gyroscope enabled)

11.3 EMB_FUNC_EN_B (05h)

Enable embedded functions register (R/W)

Table 184. EMB_FUNC_EN_B register

0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0	FIFO_COMPR_EN	0 ⁽¹⁾	0 ⁽¹⁾	FSM_EN
------------------	------------------	------------------	---	---------------	------------------	------------------	--------

1. This bit must be set to 0 for the correct operation of the device.

Table 185. EMB_FUNC_EN_B register description

FIFO_COMPR_EN ⁽¹⁾	Enables FIFO compression function. Default value: 0 (0: FIFO compression function disabled; 1: FIFO compression function enabled)
FSM_EN	Enables finite state machine (FSM) function. Default value: 0 (0: FSM function disabled; 1: FSM function enabled)

1. This bit is active when the FIFO_COMPR_RT_EN bit of FIFO_CTRL2 (08h) is set to 1.

11.4 EMB_FUNC_EXEC_STATUS (07h)

Embedded functions execution status register (R)

Table 186. EMB_FUNC_EXEC_STATUS register

0	0	0	0	0	0	EMB_FUNC_EXEC_OVR	EMB_FUNC_ENDOP
---	---	---	---	---	---	-------------------	----------------

Table 187. EMB_FUNC_EXEC_STATUS register description

EMB_FUNC_EXEC_OVR	This bit is set to 1 when the execution of the embedded functions program exceeds maximum time (new data are generated before the end of the algorithms). Default value: 0
EMB_FUNC_ENDOP	When this bit is set to 1, no embedded function is running. Default value: 0

11.5 PAGE_ADDRESS (08h)

Page address register (R/W)

Table 188. PAGE_ADDRESS register

PAGE_ADDR7	PAGE_ADDR6	PAGE_ADDR5	PAGE_ADDR4	PAGE_ADDR3	PAGE_ADDR2	PAGE_ADDR1	PAGE_ADDR0
------------	------------	------------	------------	------------	------------	------------	------------

Table 189. PAGE_ADDRESS register description

PAGE_ADDR[7:0]	After setting the bit PAGE_WRITE / PAGE_READ in register PAGE_RW (17h), this register is used to set the address of the register to be written/read in the advanced features page selected through the bits PAGE_SEL[3:0] in register PAGE_SEL (02h).
----------------	---

11.6 PAGE_VALUE (09h)

Page value register (R/W)

Table 190. PAGE_VALUE register

PAGE_VALUE7	PAGE_VALUE6	PAGE_VALUE5	PAGE_VALUE4	PAGE_VALUE3	PAGE_VALUE2	PAGE_VALUE1	PAGE_VALUE0
-------------	-------------	-------------	-------------	-------------	-------------	-------------	-------------

Table 191. PAGE_VALUE register description

PAGE_VALUE[7:0]	These bits are used to write (if the bit PAGE_WRITE = 1 in register PAGE_RW (17h)) or read (if the bit PAGE_READ = 1 in register PAGE_RW (17h)) the data at the address PAGE_ADDR[7:0] of the selected advanced features page.
-----------------	--

11.7 EMB_FUNC_INT1 (0Ah)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1. The pin's output supplies the OR combination of the selected signals.

Table 192. EMB_FUNC_INT1 register

INT1_FSM_LC	0 ⁽¹⁾	INT1_SIG_MOT	INT1_TILT	INT1_STEP_DETECTOR	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾
-------------	------------------	--------------	-----------	--------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 193. EMB_FUNC_INT1 register description

INT1_FSM_LC ⁽¹⁾	Routing FSM long counter timeout interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_SIG_MOT ⁽¹⁾	Routing significant motion event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_TILT ⁽¹⁾	Routing tilt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_STEP_DETECTOR ⁽¹⁾	Routing pedometer step recognition event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)

1. This bit is active when the INT1_EMB_FUNC bit of MD1_CFG (5Eh) is set to 1.

11.8 FSM_INT1 (0Bh)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1. The pin's output supplies the OR combination of the selected signals.

Table 194. FSM_INT1 register

INT1_FSM8	INT1_FSM7	INT1_FSM6	INT1_FSM5	INT1_FSM4	INT1_FSM3	INT1_FSM2	INT1_FSM1
-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------

Table 195. FSM_INT1 register description

INT1_FSM8 ⁽¹⁾	Routing FSM8 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM7 ⁽¹⁾	Routing FSM7 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM6 ⁽¹⁾	Routing FSM6 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM5 ⁽¹⁾	Routing FSM5 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM4 ⁽¹⁾	Routing FSM4 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM3 ⁽¹⁾	Routing FSM3 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM2 ⁽¹⁾	Routing FSM2 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)
INT1_FSM1 ⁽¹⁾	Routing FSM1 interrupt event to INT1. Default value: 0 (0: routing to INT1 disabled; 1: routing to INT1 enabled)

1. This bit is active when the INT1_EMB_FUNC bit of MD1_CFG (5Eh) is set to 1.

11.9 EMB_FUNC_INT2 (0Eh)

INT2 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT2. The pin's output supplies the OR combination of the selected signals.

Table 196. EMB_FUNC_INT2 register

INT2_FSM_LC	0 ⁽¹⁾	INT2_SIG_MOT	INT2_TILT	INT2_STEP_DETECTOR	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾
-------------	------------------	--------------	-----------	--------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 197. EMB_FUNC_INT2 register description

INT2_FSM_LC ⁽¹⁾	Routing FSM long counter timeout interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_SIG_MOT ⁽¹⁾	Routing significant motion event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_TILT ⁽¹⁾	Routing tilt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_STEP_DETECTOR ⁽¹⁾	Routing pedometer step recognition event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)

1. This bit is active when the INT2_EMB_FUNC bit of MD2_CFG (5Fh) is set to 1.

11.10 FSM_INT2 (0Fh)

INT2 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT2. The pin's output supplies the OR combination of the selected signals.

Table 198. FSM_INT2 register

INT2_FSM8	INT2_FSM7	INT2_FSM6	INT2_FSM5	INT2_FSM4	INT2_FSM3	INT2_FSM2	INT2_FSM1
-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------

Table 199. FSM_INT2 register description

INT2_FSM8 ⁽¹⁾	Routing FSM8 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM7 ⁽¹⁾	Routing FSM7 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM6 ⁽¹⁾	Routing FSM6 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM5 ⁽¹⁾	Routing FSM5 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM4 ⁽¹⁾	Routing FSM4 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM3 ⁽¹⁾	Routing FSM3 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM2 ⁽¹⁾	Routing FSM2 interrupt event on INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)
INT2_FSM1 ⁽¹⁾	Routing FSM1 interrupt event to INT2. Default value: 0 (0: routing to INT2 disabled; 1: routing to INT2 enabled)

1. This bit is active when the INT2_EMB_FUNC bit of MD2_CFG (5Fh) is set to 1.

11.11 EMB_FUNC_STATUS (12h)

Embedded function status register (R)

Table 200. EMB_FUNC_STATUS register

IS_FSM_LC	0	IS_SIGMOT	IS_TILT	IS_STEP_DET	0	0	0
-----------	---	-----------	---------	-------------	---	---	---

Table 201. EMB_FUNC_STATUS register description

IS_FSM_LC	Interrupt status bit for FSM long counter timeout interrupt event. (1: interrupt detected; 0: no interrupt)
IS_SIGMOT	Interrupt status bit for significant motion detection (1: interrupt detected; 0: no interrupt)
IS_TILT	Interrupt status bit for tilt detection (1: interrupt detected; 0: no interrupt)
IS_STEP_DET	Interrupt status bit for step detection (1: interrupt detected; 0: no interrupt)

11.12 FSM_STATUS (13h)

Finite state machine status register (R)

Table 202. FSM_STATUS register

IS_FSM8	IS_FSM7	IS_FSM6	IS_FSM5	IS_FSM4	IS_FSM3	IS_FSM2	IS_FSM1
---------	---------	---------	---------	---------	---------	---------	---------

Table 203. FSM_STATUS register description

IS_FSM8	Interrupt status bit for FSM8 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM7	Interrupt status bit for FSM7 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM6	Interrupt status bit for FSM6 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM5	Interrupt status bit for FSM5 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM4	Interrupt status bit for FSM4 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM3	Interrupt status bit for FSM3 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM2	Interrupt status bit for FSM2 interrupt event. (1: interrupt detected; 0: no interrupt)
IS_FSM1	Interrupt status bit for FSM1 interrupt event. (1: interrupt detected; 0: no interrupt)

11.13 PAGE_RW (17h)

Enable read and write mode of advanced features dedicated page (R/W)

Table 204. PAGE_RW register

EMB_FUNC_LIR	PAGE_WRITE	PAGE_READ	0 ⁽¹⁾				
--------------	------------	-----------	------------------	------------------	------------------	------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 205. PAGE_RW register description

EMB_FUNC_LIR	Latched interrupt mode for embedded functions. Default value: 0 (0: embedded functions interrupt request not latched; 1: embedded functions interrupt request latched)
PAGE_WRITE	Enables writes to the selected advanced features dedicated page. ⁽¹⁾ Default value: 0 (1: enabled; 0: disabled)
PAGE_READ	Enables reads from the selected advanced features dedicated page. ⁽¹⁾ Default value: 0 (1: enabled; 0: disabled)

1. Page selected by PAGE_SEL[3:0] in PAGE_SEL (02h) register.

11.14 EMB_FUNC_FIFO_EN_A (44h)

Embedded functions FIFO configuration register A (R/W)

Table 206. EMB_FUNC_FIFO_EN_A register

0 ⁽¹⁾	STEP_COUNTER_FIFO_EN	SFLP_GBIAS_FIFO_EN	SFLP_GRAVITY_FIFO_EN	0 ⁽¹⁾	0 ⁽¹⁾	SFLP_GAME_FIFO_EN	0 ⁽¹⁾
------------------	----------------------	--------------------	----------------------	------------------	------------------	-------------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 207. EMB_FUNC_FIFO_EN_A register description

STEP_COUNTER_FIFO_EN	Enables batching the step counter values in the FIFO buffer. Default value: 0 (0: disabled; 1: enabled)
SFLP_GBIAS_FIFO_EN	Enables batching the gyroscope bias values computed by the SFLP algorithm in the FIFO buffer. Default value: 0 (0: disabled; 1: enabled)
SFLP_GRAVITY_FIFO_EN	Enables batching the gravity values computed by the SFLP algorithm in the FIFO buffer. Default value: 0 (0: disabled; 1: enabled)
SFLP_GAME_FIFO_EN	Enables batching the game rotation vector (quaternion) values computed by the SFLP algorithm in the FIFO buffer. Default value: 0 (0: disabled; 1: enabled)

11.15 FSM_ENABLE (46h)

Enable FSM register (R/W)

Table 208. FSM_ENABLE register

FSM8_EN	FSM7_EN	FSM6_EN	FSM5_EN	FSM4_EN	FSM3_EN	FSM2_EN	FSM1_EN
---------	---------	---------	---------	---------	---------	---------	---------

Table 209. FSM_ENABLE register description

FSM8_EN	Enables FSM8. Default value: 0 (0: FSM8 disabled; 1: FSM8 enabled)
FSM7_EN	Enables FSM7. Default value: 0 (0: FSM7 disabled; 1: FSM7 enabled)
FSM6_EN	Enables FSM6. Default value: 0 (0: FSM6 disabled; 1: FSM6 enabled)
FSM5_EN	Enables FSM5. Default value: 0 (0: FSM5 disabled; 1: FSM5 enabled)
FSM4_EN	Enables FSM4. Default value: 0 (0: FSM4 disabled; 1: FSM4 enabled)
FSM3_EN	Enables FSM3. Default value: 0 (0: FSM3 disabled; 1: FSM3 enabled)
FSM2_EN	Enables FSM2. Default value: 0 (0: FSM2 disabled; 1: FSM2 enabled)
FSM1_EN	Enables FSM1. Default value: 0 (0: FSM1 disabled; 1: FSM1 enabled)

11.16 FSM_LONG_COUNTER_L (48h) and FSM_LONG_COUNTER_H (49h)

FSM long counter status register (R/W)

Long counter value is an unsigned integer value (16-bit format).

Table 210. FSM_LONG_COUNTER_L register

FSM_LC_7	FSM_LC_6	FSM_LC_5	FSM_LC_4	FSM_LC_3	FSM_LC_2	FSM_LC_1	FSM_LC_0
----------	----------	----------	----------	----------	----------	----------	----------

FSM_LC_[7:0]	Long counter current value (LSbyte). Default value: 00000000
--------------	--

Table 212. FSM_LONG_COUNTER_H register

FSM_LC_15	FSM_LC_14	FSM_LC_13	FSM_LC_12	FSM_LC_11	FSM_LC_10	FSM_LC_9	FSM_LC_8
-----------	-----------	-----------	-----------	-----------	-----------	----------	----------

Table 213. FSM_LONG_COUNTER_H register description

FSM_LC_[15:8]	Long counter current value (MSbyte). Default value: 00000000
---------------	--

11.17 INT_ACK_MASK (4Bh)

Reset status register (R/W)

Table 214. INT_ACK_MASK register

IACK_MASK7	IACK_MASK6	IACK_MASK5	IACK_MASK4	IACK_MASK3	IACK_MASK2	IACK_MASK1	IACK_MASK0
------------	------------	------------	------------	------------	------------	------------	------------

Table 215. INT_ACK_MASK register description

IACK_MASK7	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 7 of the status register is not reset. When this bit is set to 0, bit 7 of the status register is reset. Default value: 0
IACK_MASK6	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 6 of the status register is not reset. When this bit is set to 0, bit 6 of the status register is reset. Default value: 0
IACK_MASK5	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 5 of the status register is not reset. When this bit is set to 0, bit 5 of the status register is reset. Default value: 0
IACK_MASK4	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 4 of the status register is not reset. When this bit is set to 0, bit 4 of the status register is reset. Default value: 0
IACK_MASK3	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 3 of the status register is not reset. When this bit is set to 0, bit 3 of the status register is reset. Default value: 0
IACK_MASK2	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 2 of the status register is not reset. When this bit is set to 0, bit 2 of the status register is reset. Default value: 0
IACK_MASK1	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 1 of the status register is not reset. When this bit is set to 0, bit 1 of the status register is reset. Default value: 0
IACK_MASK0	If set to 1, when reading the EMB_FUNC_STATUS (12h) / EMB_FUNC_STATUS_MAINPAGE (49h), FSM_STATUS (13h) / FSM_STATUS_MAINPAGE (4Ah) and / registers in latched mode (when the EMB_FUNC_LIR bit is set to 1 in the PAGE_RW (17h) register), bit 0 of the status register is not reset. When this bit is set to 0, bit 0 of the status register is reset. Default value: 0

11.18 FSM_OUTS1 (4Ch)

FSM1 output register (R)

Table 216. FSM_OUTS1 register

P_axis_1	N_axis_1	P_axis_2	N_axis_2	P_axis_3	N_axis_3	P_V	N_V
----------	----------	----------	----------	----------	----------	-----	-----

Table 217. FSM_OUTS1 register description

P_axis_1	FSM1 output: positive event detected on axis 1. This axis corresponds to the X-axis if the gyroscope is used and to the Z-axis if the accelerometer is used. (0: event not detected; 1: event detected)
N_axis_1	FSM1 output: negative event detected on axis 1. This axis corresponds to the X-axis if the gyroscope is used and to the Z-axis if the accelerometer is used. (0: event not detected; 1: event detected)
P_axis_2	FSM1 output: positive event detected on axis 2. This axis corresponds to the Y-axis for both the gyroscope and accelerometer. (0: event not detected; 1: event detected)
N_axis_2	FSM1 output: negative event detected on axis 2. This axis corresponds to the Y-axis for both the gyroscope and accelerometer. (0: event not detected; 1: event detected)
P_axis_3	FSM1 output: positive event detected on axis 3. This axis corresponds to the Z-axis if the gyroscope is used and to the X-axis if the accelerometer is used. (0: event not detected; 1: event detected)
N_axis_3	FSM1 output: negative event detected on axis 3. This axis corresponds to the Z-axis if the gyroscope is used and to the X-axis if the accelerometer is used. (0: event not detected; 1: event detected)
P_V	FSM1 output: positive event detected on the vector. (0: event not detected; 1: event detected)
N_V	FSM1 output: negative event detected on the vector. (0: event not detected; 1: event detected)

1. This bit must be set to 0 for the correct operation of the device.

Table 245. EMB_FUNC_INIT_B register description

FIFO_COMPR_INIT	FIFO compression function initialization request. Default value: 0
FSM_INIT	FSM initialization request. Default value: 0

12 Embedded advanced features pages

The table given below provides a list of the registers for the embedded advanced features page 0. These registers are accessible when PAGE_SEL[3:0] are set to 0000 in PAGE_SEL (02h).

Table 246. Register address map - embedded advanced features page 0

Name	Type	Register address		Default	Comment
		Hex	Binary		
SFLP_GAME_GBIASX_L	R/W	6E	01101110	00000000	
SFLP_GAME_GBIASX_H	R/W	6F	01101111	00000000	
SFLP_GAME_GBIASY_L	R/W	70	01110000	00000000	
SFLP_GAME_GBIASY_H	R/W	71	01110001	00000000	
SFLP_GAME_GBIASZ_L	R/W	72	01110010	00000000	
SFLP_GAME_GBIASZ_H	R/W	73	01110011	00000000	

The following table provides a list of the registers for the embedded advanced features page 1. These registers are accessible when PAGE_SEL[3:0] are set to 0001 in PAGE_SEL (02h).

Table 247. Register address map - embedded advanced features page 1

Name	Type	Register address		Default	Comment
		Hex	Binary		
FSM_LC_TIMEOUT_L	R/W	7A	01111010	00000000	
FSM_LC_TIMEOUT_H	R/W	7B	01111011	00000000	
FSM_PROGRAMS	R/W	7C	01111100	00000000	
FSM_START_ADD_L	R/W	7E	01111110	00000000	
FSM_START_ADD_H	R/W	7F	01111111	00000000	
PEDO_CMD_REG	R/W	83	10000011	00000000	
PEDO_DEB_STEPS_CONF	R/W	84	10000100	00001010	
PEDO_SC_DELTAT_L	R/W	D0	11010000	00000000	
PEDO_SC_DELTAT_H	R/W	D1	11010001	00000000	

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Write procedure example: write value 06h in register at address 84h (PEDO_DEB_STEPS_CONF) in page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_WRITE = 1 in PAGE_RW (17h) register // Select write operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Write 06h in PAGE_DATA register (09h) // Set value to be written
6. Write bit PAGE_WRITE = 0 in PAGE_RW (17h) register // Write operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Read procedure example: read value of register at address 84h (PEDO_DEB_STEPS_CONF) in page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_READ = 1 in PAGE_RW (17h) register // Select read operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Read value of PAGE_DATA register (09h) // Get register value
6. Write bit PAGE_READ = 0 in PAGE_RW (17h) register // Read operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Note:

Steps 1 and 2 of both procedures are intended to be performed at the beginning of the procedure. Steps 6 and 7 of both procedures are intended to be performed at the end of the procedure. If the procedure involves multiple operations, only steps 3, 4 and 5 must be repeated for each operation. If, in particular, the multiple operations involve consecutive registers, only step 5 can be performed.

13 Embedded advanced features register description

13.1 Page 0 - embedded advanced features registers

13.1.1 SFLP_GAME_GBIASX_L (6Eh) and SFLP_GAME_GBIASX_H (6Fh)

SFLP game algorithm X-axis gyroscope bias register (R/W)

The value is expressed as half-precision floating-point format: SEEEEEFFFFFF (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

14 Soldering information

The LGA package is compliant with the [ECOPACK](#) and RoHS standard.

It is qualified for soldering heat resistance according to JEDEC J-STD-020.

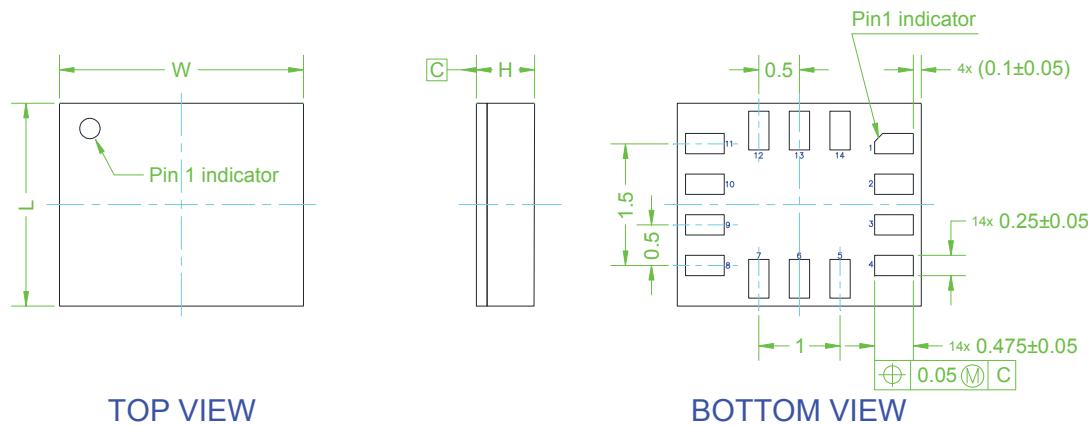

For land pattern and soldering recommendations, consult technical note [TN0018](#) available on [www.st.com](#).

15 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.
